Cobrowsing for sales and support

Keep phone conversations short and simple, exactly see what your visitor is talking about.

The image displays a cobrowsing interface with two side-by-side browser windows. The left window, labeled 'Visitor', shows a checkout page for a lamp titled 'Is Trumplight - White €699,-'. The right window, labeled 'Agent', shows a blank page. A play button icon is overlaid between the two windows, indicating a transition or shared view.

Sales Training Example (multilingual) 📄 Progress

The new training location looks really great!

Angracia Houston 2 months, 4 days ago

Remove

Gorgeous!! is it still being used as a train station as well? Hopefully we'll meet again there next time!
Frank Write 2 months, 4 days ago

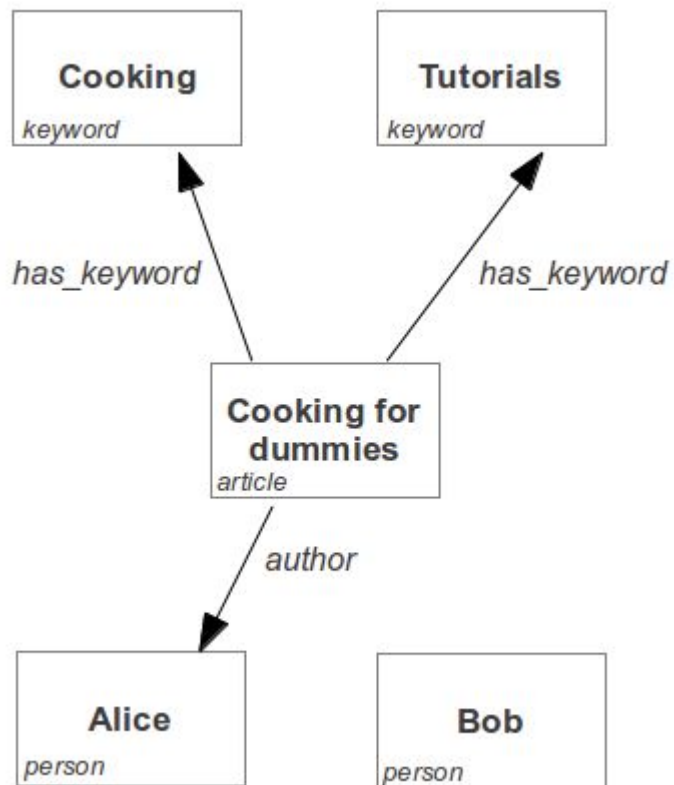

Actually the trains do still pass there!

Templates

Templates are text files marked up using the Zotonic template language. Zotonic interprets that mark-up to dynamically generate HTML pages. Zotonic's template syntax is very similar to the Django Template Language (DTL).

Variables

Variables are surrounded by `{{` and `}}` (double braces):

```
Hello, I'm {{ first_name }} {{ last_name }}.
```

When rendering this template, you need to pass the variables to it. If you pass `James` for `first_name` and `Bond` for `last_name`, the template renders to:

```
Hello, I'm James Bond.
```

Instead of strings, variables can also be objects that contain attributes. To access the attributes, use dot notation:

```
{{ article.title }} was created by {{ article.author.last_name }}
```

The variables that you add to your templates get their values from three places:

- they can be [passed from controllers](#) when rendering the template;
- they can come from [models](#);

```
$ docker run \  
  -v `pwd`:/opt/zotonic/user/sites \  
  -p 8443:8443 zotonic/zotonic-heavy
```

```
{% for result in m.search[{recommend hasobject=[id, 'author']}] as results %}
```

```
-module(yoursite).
```

```
-include_lib("zotonic_core/include/zotonic.hrl").
```

```
observe_search_query(#search_query{search = {recommend, Args}} = Query, Context) ->
```

```
    recommend:search(Query, Context);
```

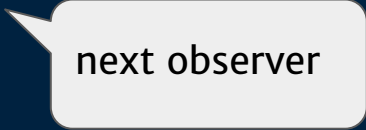

```
observe_search_query(_, _) ->
```

```
    undefined.
```

next observer,
based on prio

```
-module(yoursite).
-include_lib("zotonic_core/include/zotonic.hrl").

observe_acl_is_allowed(#acl_is_allowed{action = view, object = Id}, Context) ->
    case m_rsc:is_a(Id, recommendation, Context) of
        true ->
            custom_acl:can_view_recommendation(Id, Context);
        false ->
            undefined
    end;
observe_acl_is_allowed(#acl_is_allowed{}, _Context) ->
    undefined.
```

next observer

The diff you're trying to view is too large. We only load the first 3000 changed files.

ferd commented on Aug 10, 2016

Owner

In fact, I can't publish erlpass to hex because the bcrypt dependencies on there are too old. Can't do it for now.

README.md

hexpub: + + =

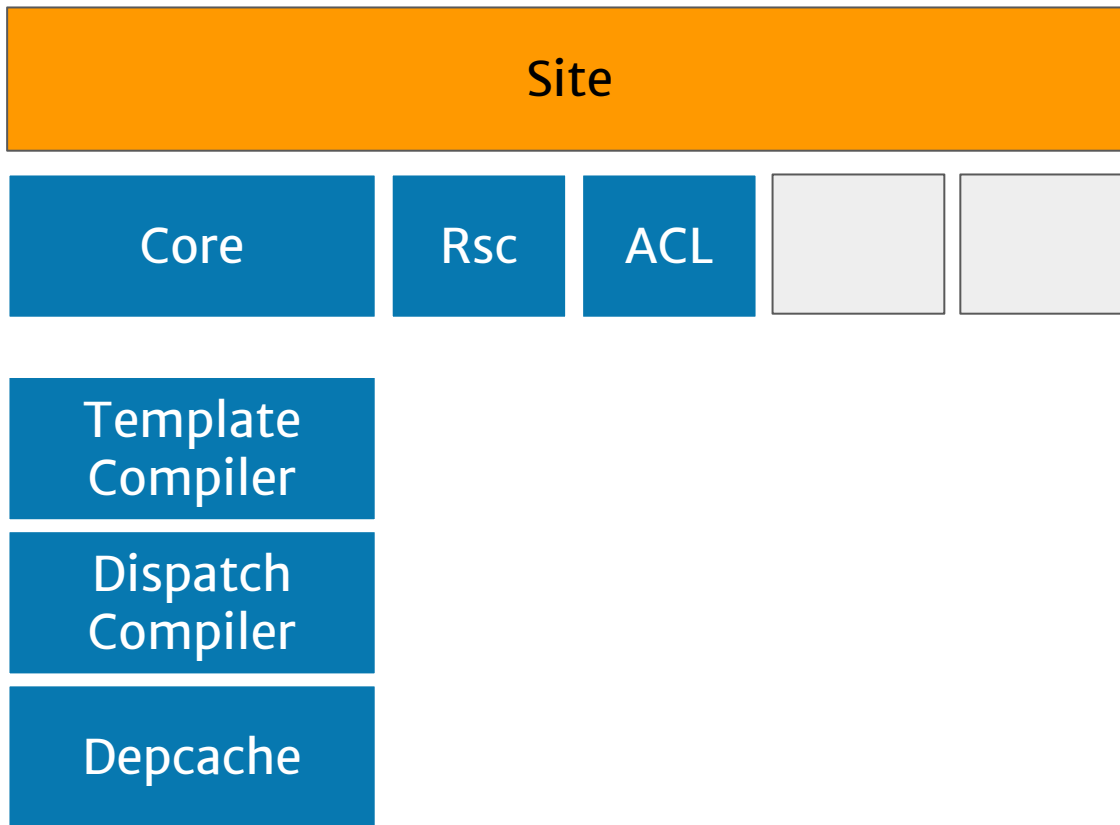

Keeping our packages up to date on [Hex.pm](#) is something we all forget too easily. This little script and Travis CI configuration automates publishing when you tag your Git repository.

Because Travis CI has no [Hex.pm deployment provider](#) (yet), we'll have to do some more work. This solution is based on an [article by Tristan Slouhter](#).

As application server

As dependency

Thanks!
