

Finding Race Conditions during Unit Testing with QuickCheck

John Hughes (Quviq/Chalmers)

Koen Claessen, Michal Palka, Nick
Smallbone (Chalmers)

Thomas Arts, Hans Svensson
(Quviq/Chalmers)

Ulf Wiger, (Erlang Training and
Consulting)

Race Conditions

- Everybody's nightmare!
 - Timing dependent, often don't show up until system testing
 - Hard to reproduce
 - More likely to strike on multicore processors
 - Erlang is not immune
- **Goal:** find race conditions in *unit testing*, using QuickCheck and PULSE
- **Story:** Ulf Wiger's extended process registry

From Unit Testing to QuickCheck

- **Example:** `lists:delete/2` removes an element from a list

```
delete_present_test() ->  
    ?assertEqual([1,3], lists:delete(2, [1,2,3])).  
  
delete_absent_test() ->  
    ?assertEqual([1,2,3], lists:delete(4, [1,2,3])).
```

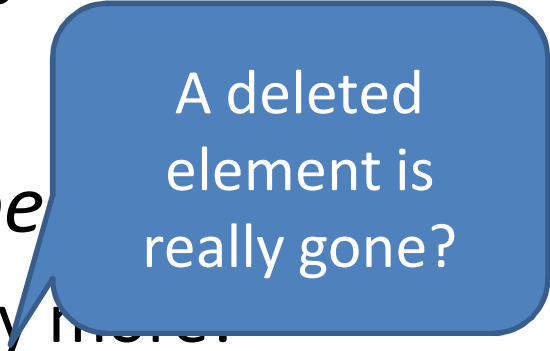

- Did I think of enough cases?
- How much time/energy/code am I prepared to spend on this?

Property Based Testing

- Generate test cases instead
 - As many as you like!
 - **Challenge:** from what universe?
 - **Challenge:** understandable failures
- Decide test outcome with a *property*
 - **Challenge:** no "expected value" any more.
 - Need to formulate a general property

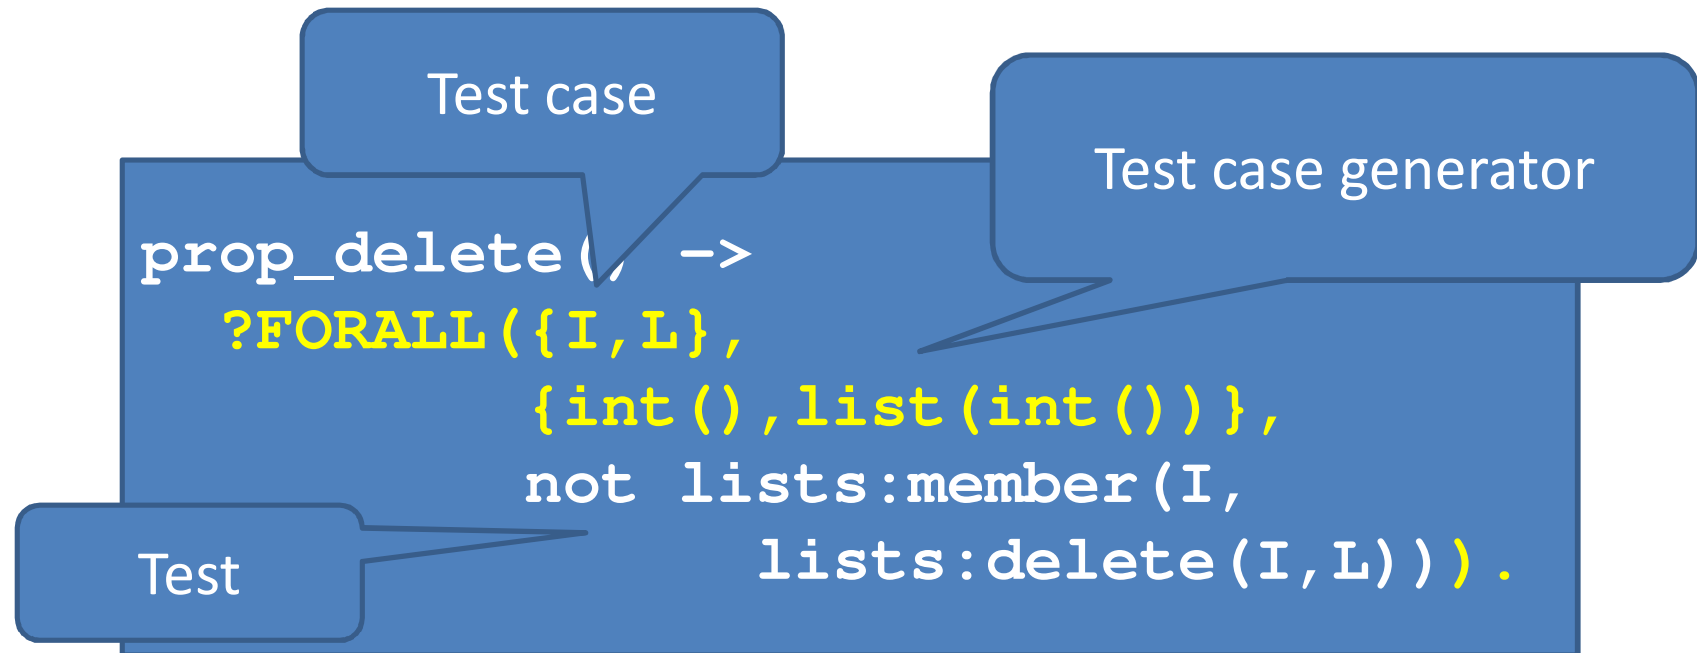

`int()` and `list(int())`

A deleted
element is
really gone?

A property of lists:delete

```
21> eqc:quickcheck(examples:prop_delete()) .
```

```
.....  
.....
```

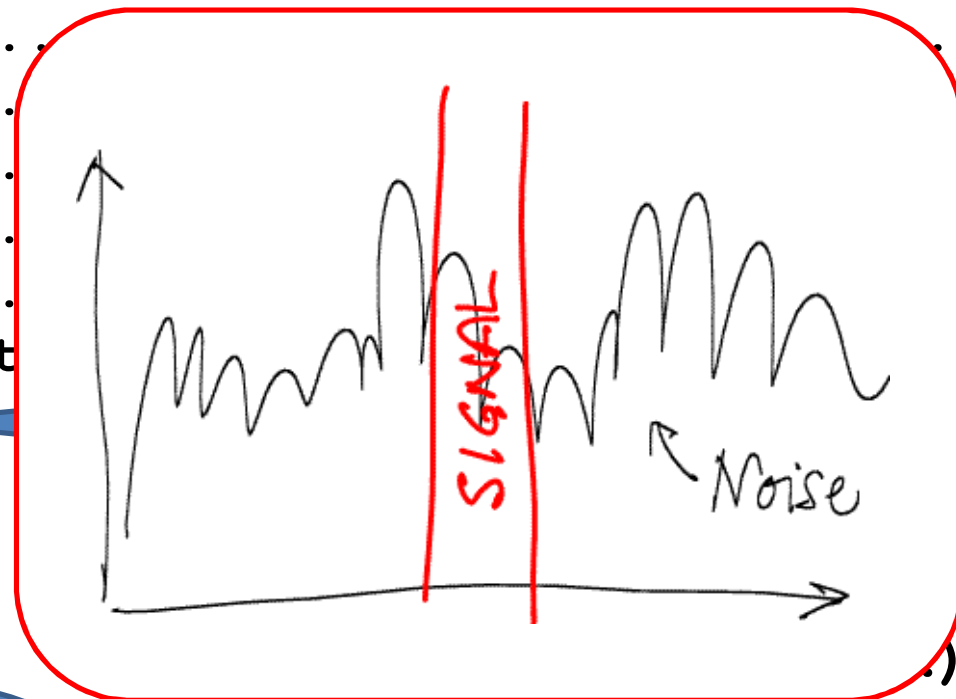

```
OK, passed 100 tests
```

Or maybe not...

```
29> eqc:quickcheck(eqc:numtests(1000, examples:prop_delete()) ).
```

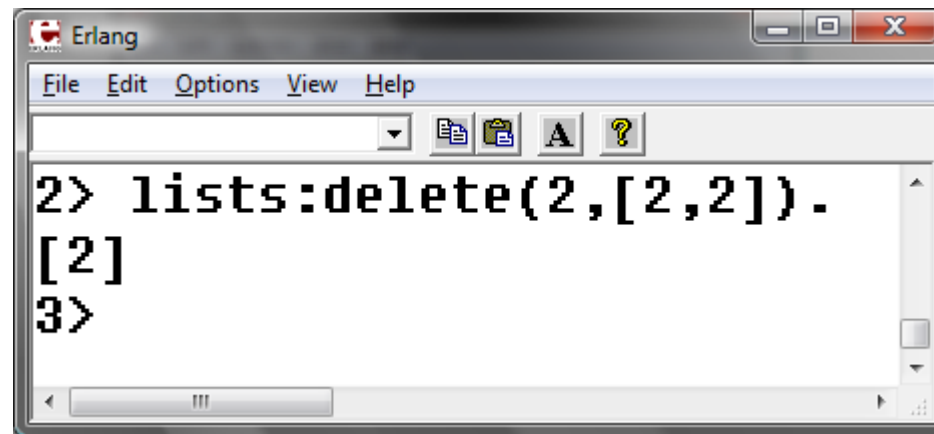

```
.....  
.....  
.....  
.....  
.....  
.....  
.....
```

```
...Failed! After 346 test  
{2, [-7, -13, -15, 2, 2]}  
Shrinking. (1 times)  
{2, [2, 2]}  
false
```

A simplest
failing test

What's going on?

A screenshot of an Erlang shell window. The window has a title bar with the Erlang logo and the word "Erlang". Below the title bar is a menu bar with "File", "Edit", "Options", "View", and "Help". Under the menu bar is a toolbar with icons for a dropdown menu, a document, a folder, a text editor, and a question mark. The main area of the window is a text input field containing the following text:

```
2> lists:delete(2,[2,2]).  
[2]  
3>
```

The text is in a monospaced font. The window has a scrollbar on the right side.

- This is supposed to happen!
 - `lists:delete` removes *one* occurrence
 - We need a test case where the element occurs twice

Process Registry is Stateful

- What functions do we want to test?
 - register(Name,Pid), unregister(Name)
 - spawn(), kill(Pid)
- Test cases?
 - Sequences of *calls* to API under test

```
[{set, {var, 1}, {call, reg_eqc, spawn, []}},  
 {set, {var, 2}, {call, erlang, register, [a, {var, 1}]}}]
```

Just Erlang terms...
symbolic

`v1 = spawn() ,
v2 = register(a, v1) .`

Abstract Mod

- Model

Command
generators

-recor

tr

re

accu

De

itions

ed pids

- De

```
next_state = (unreg, register, [Name, Pid]) ->  
  S#state[regs=[Name, Pid] | S#state.regs];  
.....
```

What's the property?

- For all sequences of API calls
- ...where all the preconditions are true
- ...no uncaught exceptions
- ...and all the postconditions are true.

The meat is in the pre-
and postconditions and
the state model

```
prop_registration() ->  
  ?FORALL(Cmds, commands(?MODULE),  
    begin  
      {H,S,Res} = run_commands(?MODULE,Cmds),  
      [catch unregister(N) || N<-?names],  
      Res==ok  
    end) .
```

```
postcondition(S, {call, ?MODULE, register, [Name, Pid]}, V) ->
  case register_ok(S, Name, Pid) of
    true -> V==true;
    false -> is_exit(V)
  end.
```

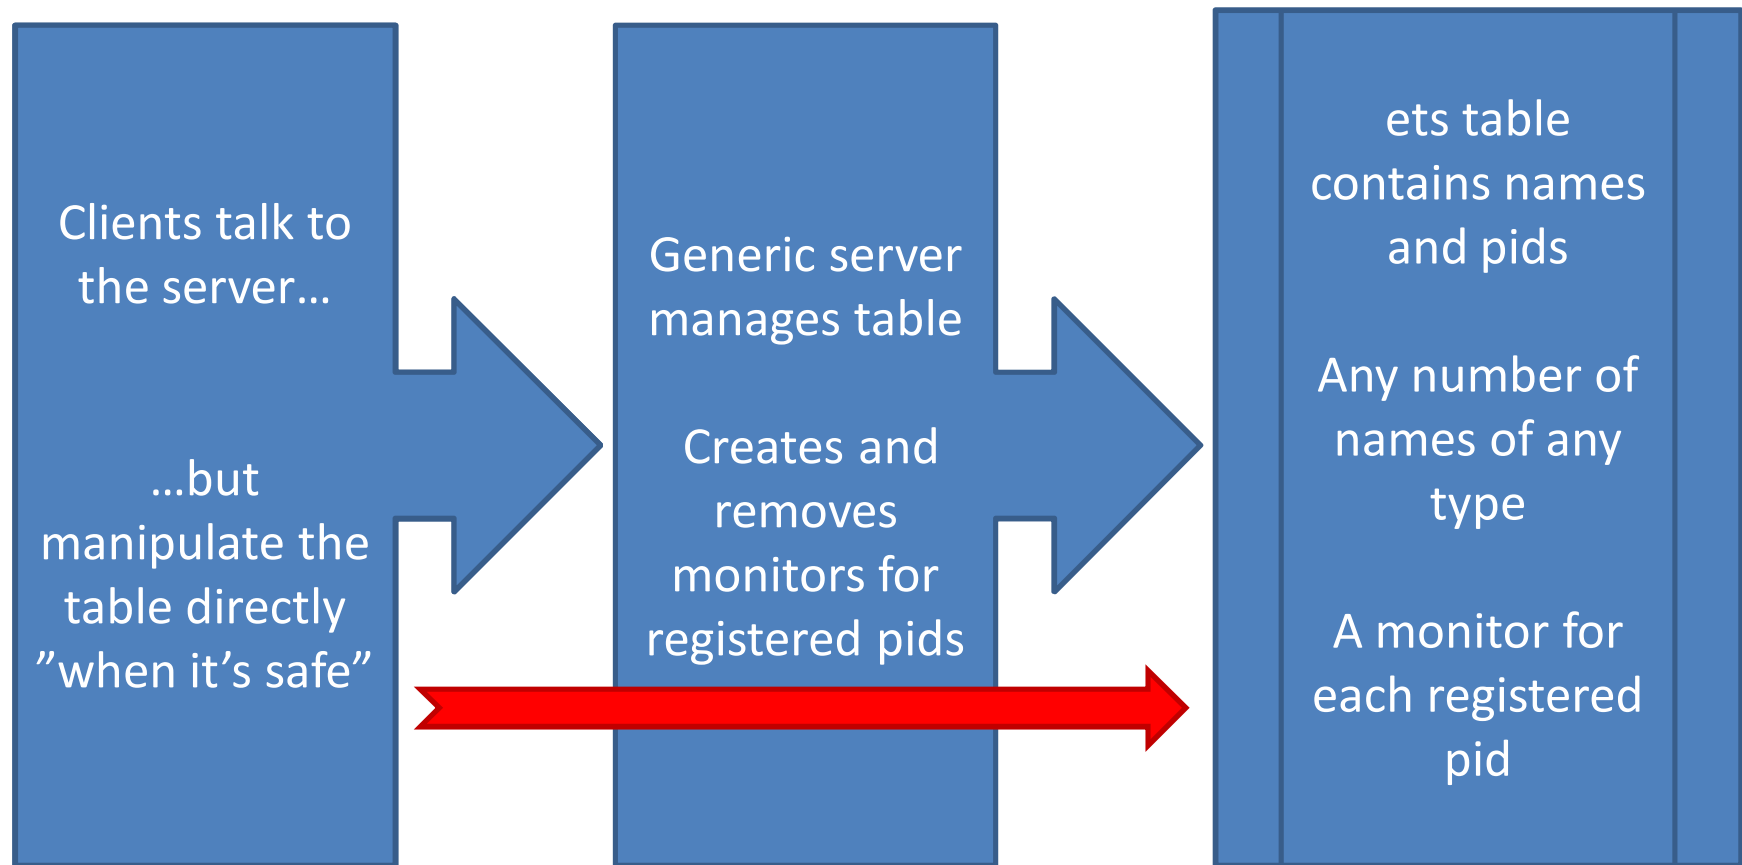

```
register_ok(S, Name, Pid) ->
  not lists:keymember(Name, 1, S#state.regs) andalso
  not lists:keymember(Pid, 2, S#state.regs).
```

```
[{set, {var, 2}, {call, reg_eqc, spawn, []}},
 {set, {var, 3}, {call, reg_eqc, register, [a, {var, 2}]}},
 {set, {var, 5}, {call, reg_eqc, register, [b, {var, 2}]}},
 false
27> █
```

**A Pid can only
be registered
with *one*
name!**

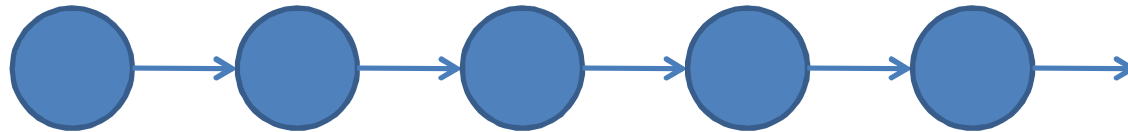

```
V2 = spawn(),
V3 = register(a, V2),
V5 = register(b, V2).
```

Extended Process Registry

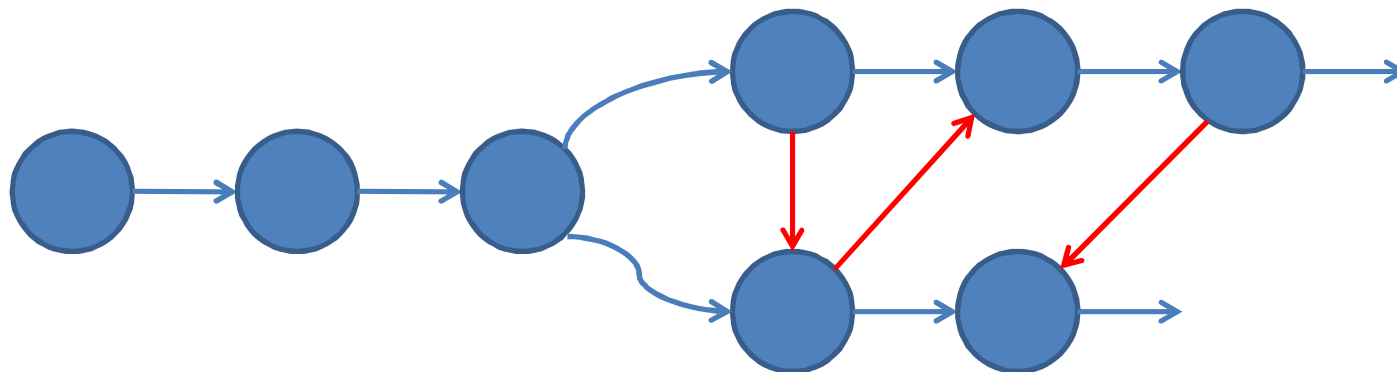

What is a Parallel Test Case?

- Sequential test case:

- Parallel test case:

- *We reuse* the specification of the sequential case

Testing the EPR

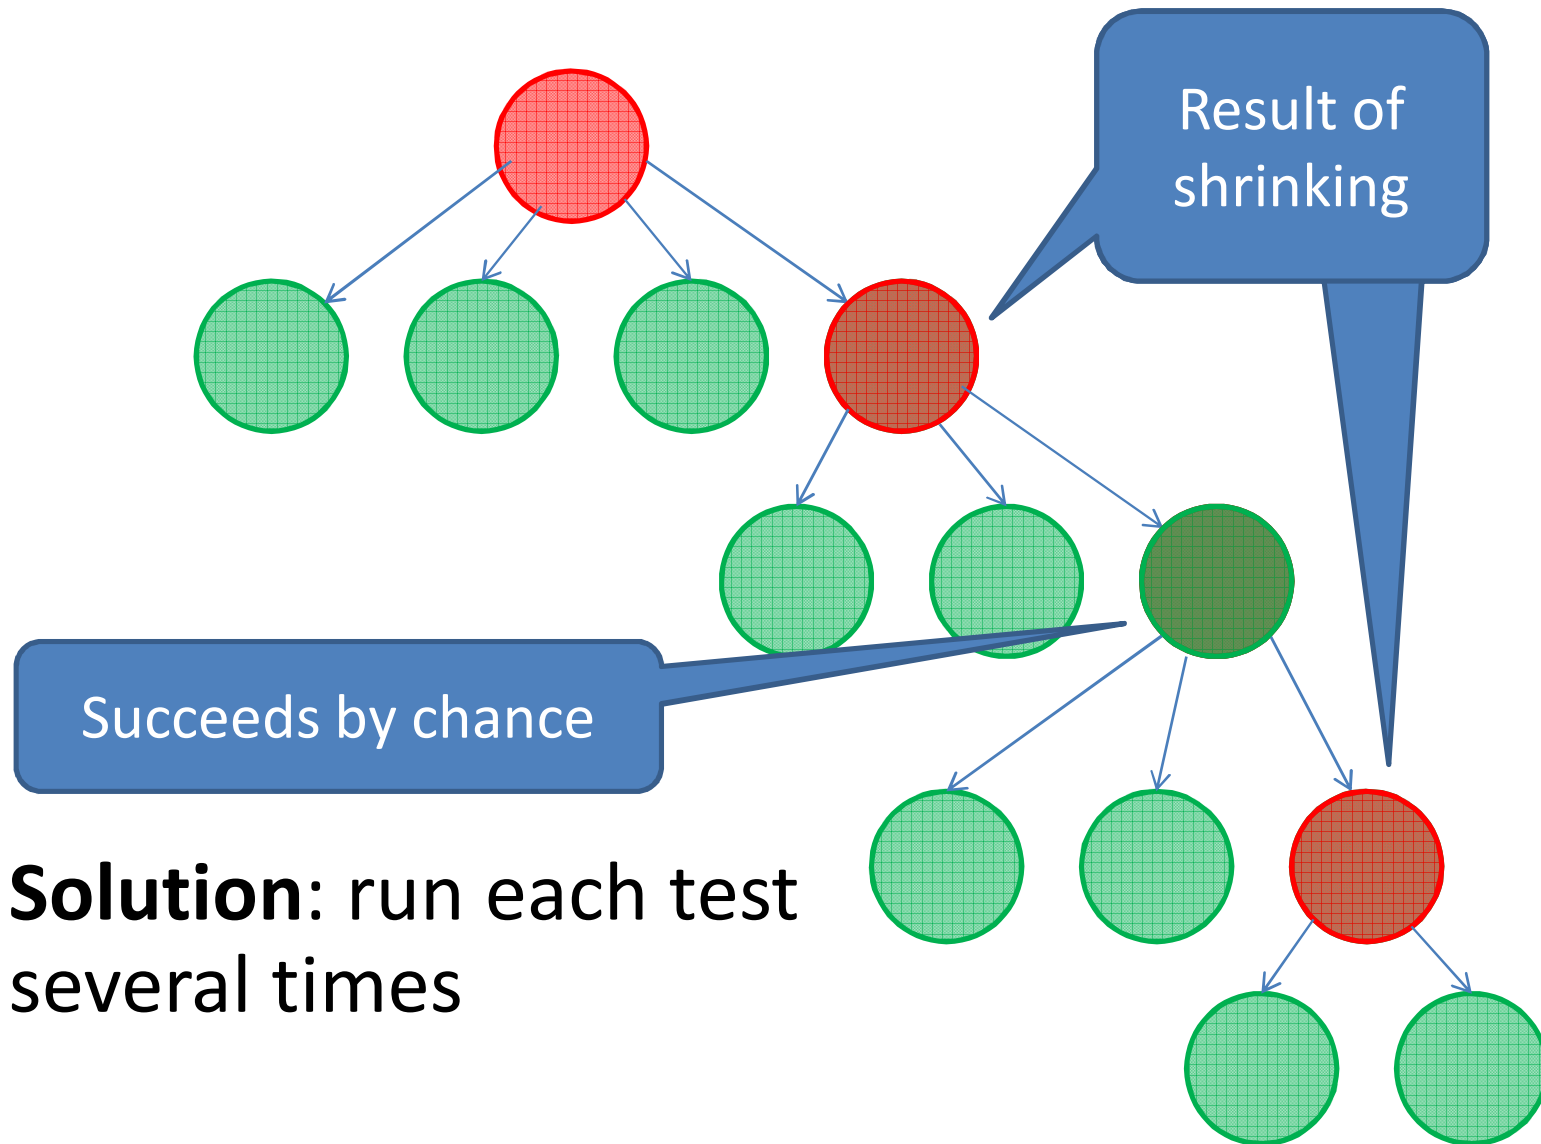

```

Erlang
File Edit Options View Help
< [?]
    {{call,proc_reg_eqc,kill,[<0.2252.1>}],ok}}
Res: no_possible_interleaving
Shrinking.....(12 times)
{[{set,{var,1},{call,proc_reg_eqc,spawn,[],}},
 {set,{var,2},{call,proc_reg_eqc,kill,[{var,1}]}},
 {set,{var,5},{call,proc_reg_eqc,reg,[b,{var,1}]}},
 {set,{var,12},{call,proc_reg_eqc,spawn,[],}},
 {set,{var,14},{call,proc_reg_eqc,kill,[{var,12}]}},
 [{set,{var,18},{call,proc_reg_eqc,reg,[b,{var,12}]}},
 [{set,{var,19},{call,proc_reg_eqc,reg,[b,{var,12}]}]}]}}
Sequential: 1<<state.11.11.11>. <0.4615.1>.

```

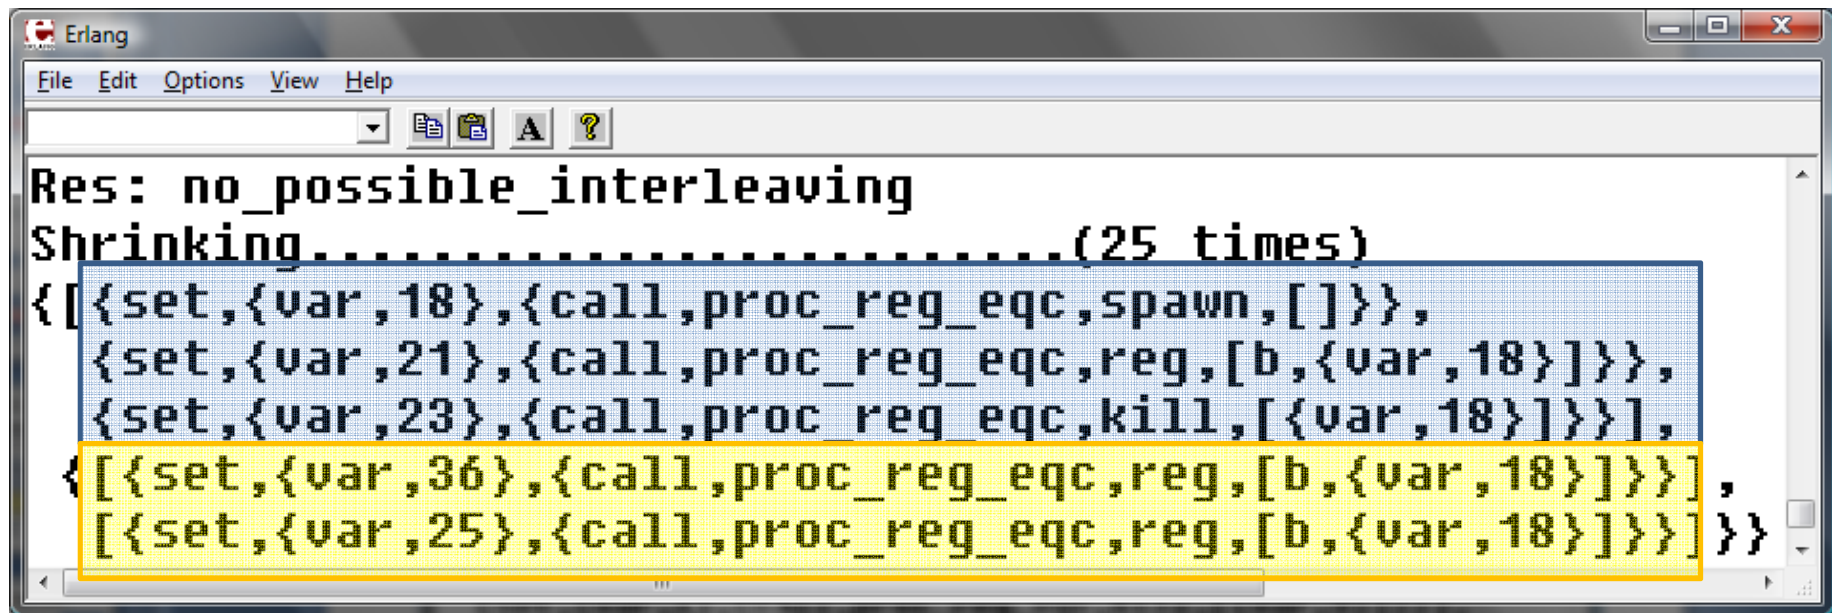

- Must it be so complicated?

How Shrinking Works

Shrinking the EPR failure

- With test repetition...

The screenshot shows an Erlang shell window with the following text:

```
Res: no_possible_interleaving
Shrinking.....(25 times)
{[{set,{var,18},{call,proc_reg_eqc,spawn,[]}}},
 {set,{var,21},{call,proc_reg_eqc,reg,[b,{var,18}]}}},
 {set,{var,23},{call,proc_reg_eqc,kill,[{var,18}]}]},
 [{set,{var,36},{call,proc_reg_eqc,reg,[b,{var,18}]}}},
  [{set,{var,25},{call,proc_reg_eqc,reg,[b,{var,18}]}}}]}}
```

The first three lines are in a blue highlight, and the last two lines are in a yellow highlight.

- Every step is necessary
- The last two *must* be in parallel

event wrong?

The pid is dead!
Registering a dead pid
should *always* "succeed"

```

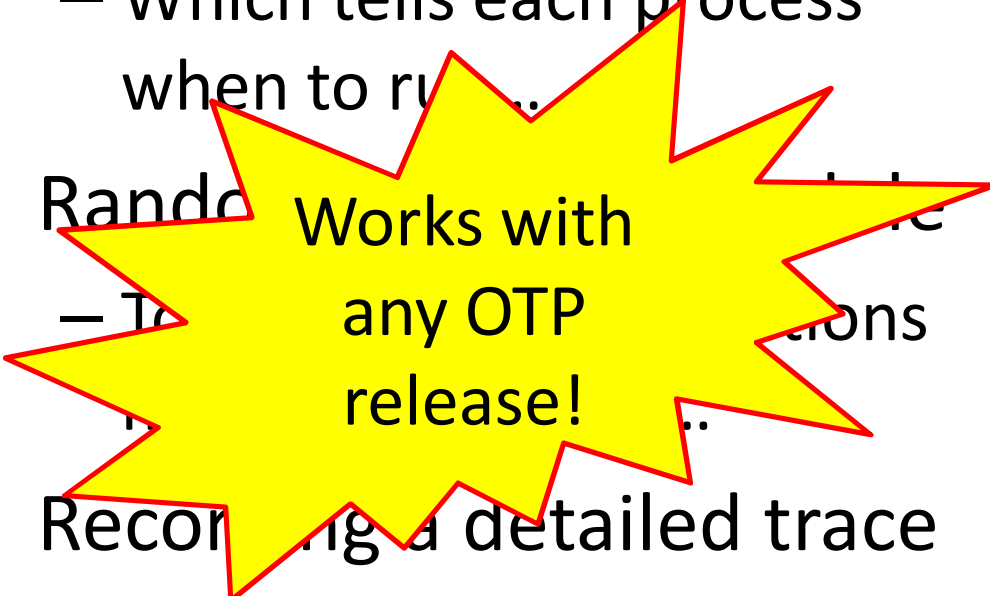

R
Sh
.....(25 times)
{[{set, 18},{call,proc_reg_eqc,spawn,[ ]}},
 {set, 21},{call,proc_reg_eqc,reg,[b,{var,18}]}},
 {set, 23},{call,proc_reg_eqc,kill,[{var,18}]}},
 [{set, 36},{call,proc_reg_eqc,reg,[b,{var,18}]}]},
 [{set, 25},{call,proc_reg_eqc,reg,[b,{var,18}]}]}]}

Parallel: {[{call,proc_reg_eqc,reg,[b,<0.3155.2>]],true},
           [{call,proc_reg_eqc,reg,[b,<0.3155.2>]],
            {'EXIT',{badarg,[{proc_reg,reg,2},
                             {proc_reg_eqc,reg,2},
                             {parallel2,run,2},
                             {parallel2,'-run_pcommands/
Res: no_possible_interleaving
```

But what happened?

ProTest
User
Level
Scheduler
for Erlang

- Instruments Erlang code
 - To make it talk to...
- *A user-level scheduler*
 - Which tells each process when to run...
- Randomly interleaves processes
 - To make sure that all processes get a chance to run...
- Recording a detailed trace

Works with
any OTP
release!

Pulsing the EPR

- PULSE provokes an even simpler counterexample:

```
{ [{set, {var, 9}, {call, proc_reg_eqc, spawn, []}},  
  {set, {var, 10}, {call, proc_reg_eqc, kill, [{var, 9}]}},  
  [{set, {var, 15}, {call, proc_reg_eqc, reg, [c, {var, 9}]}},  
    {set, {var, 12}, {call, proc_reg_eqc, reg, [c, {var, 9}]}},  
    ]}] }
```

- As before, one of the calls to reg raises an exception.
- All we need is a dead process!

Inspecting the Trace

```
-> <'start_link.Pid1'> call  
  scheduler:process  
  return normal  
-> <'start_  
  '{call,{att  
  <  
  to <'s  
-> <'start_  
*** unbl  
  by delivering 26.0>},  
  2  
  #.0.0.0.3087>}  
  sent by <'start_l.Pid1'  
...
```

!#@%?!
&!!

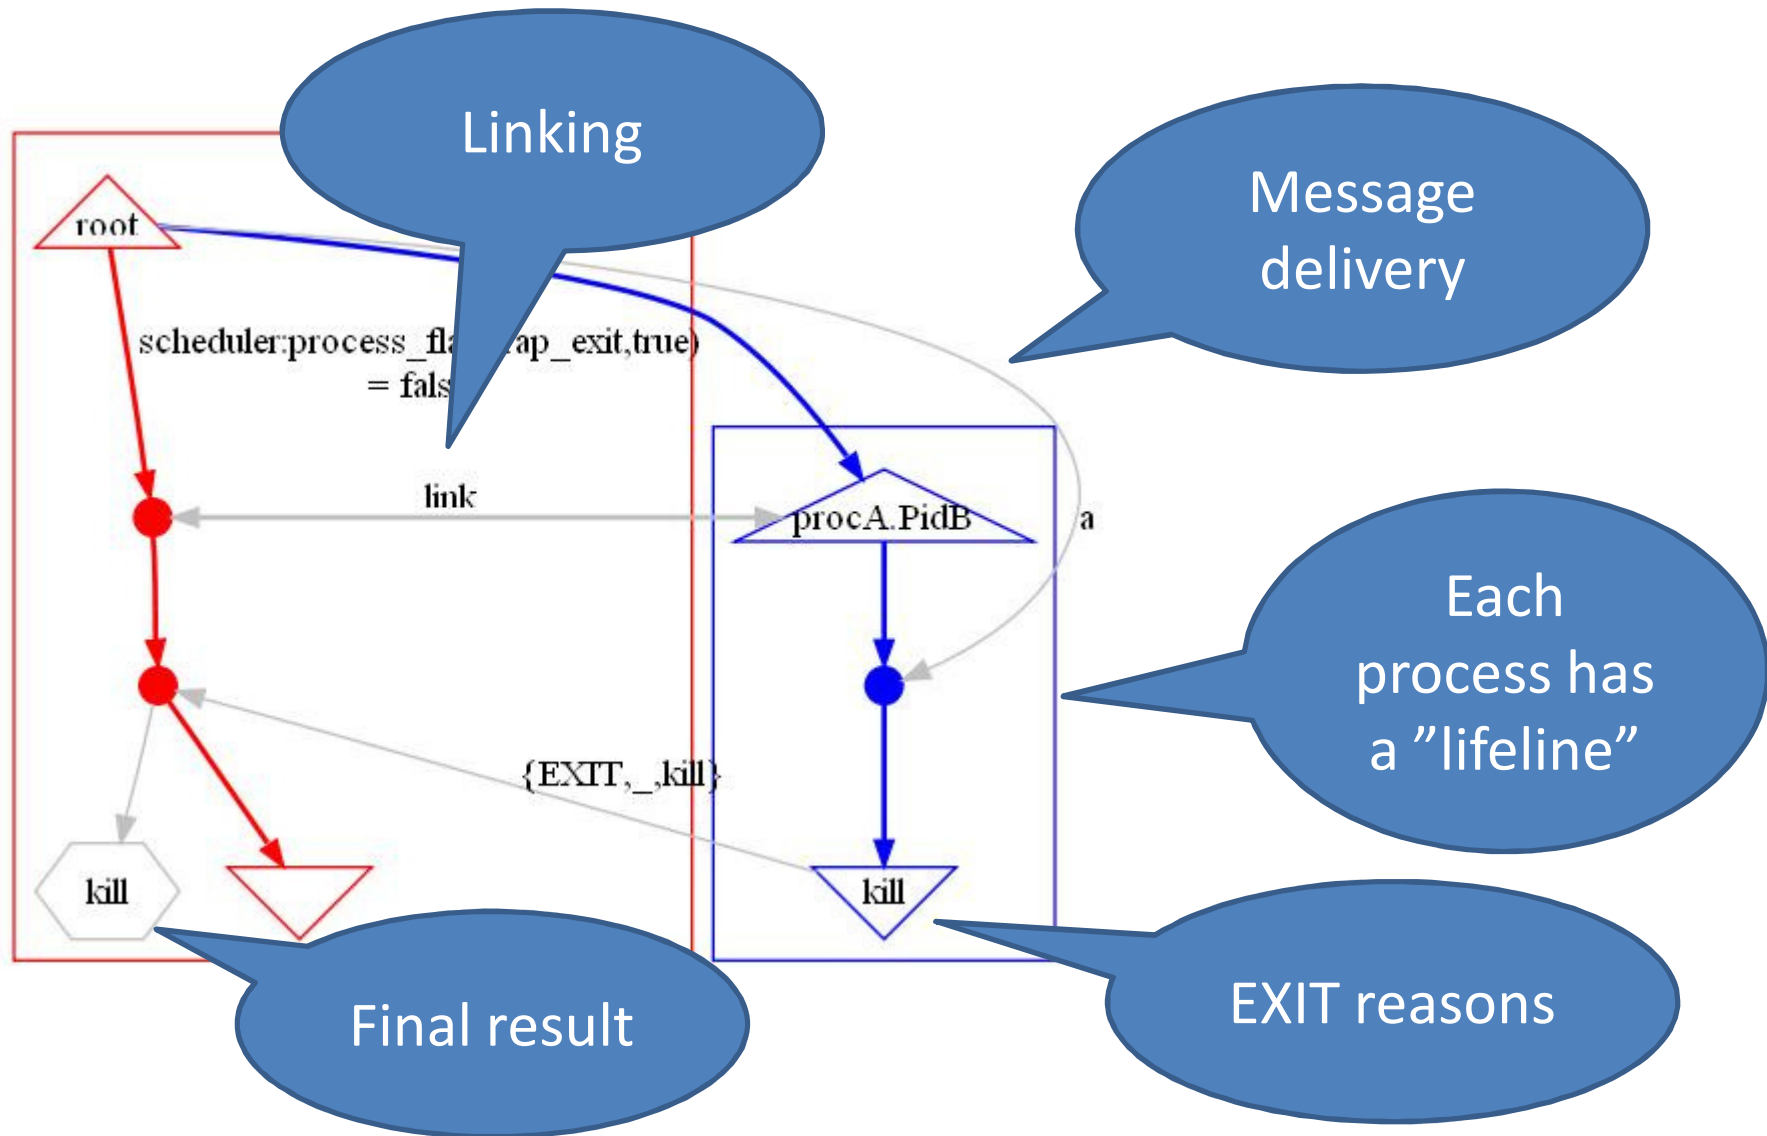

Trace Visualization

- A simple example:

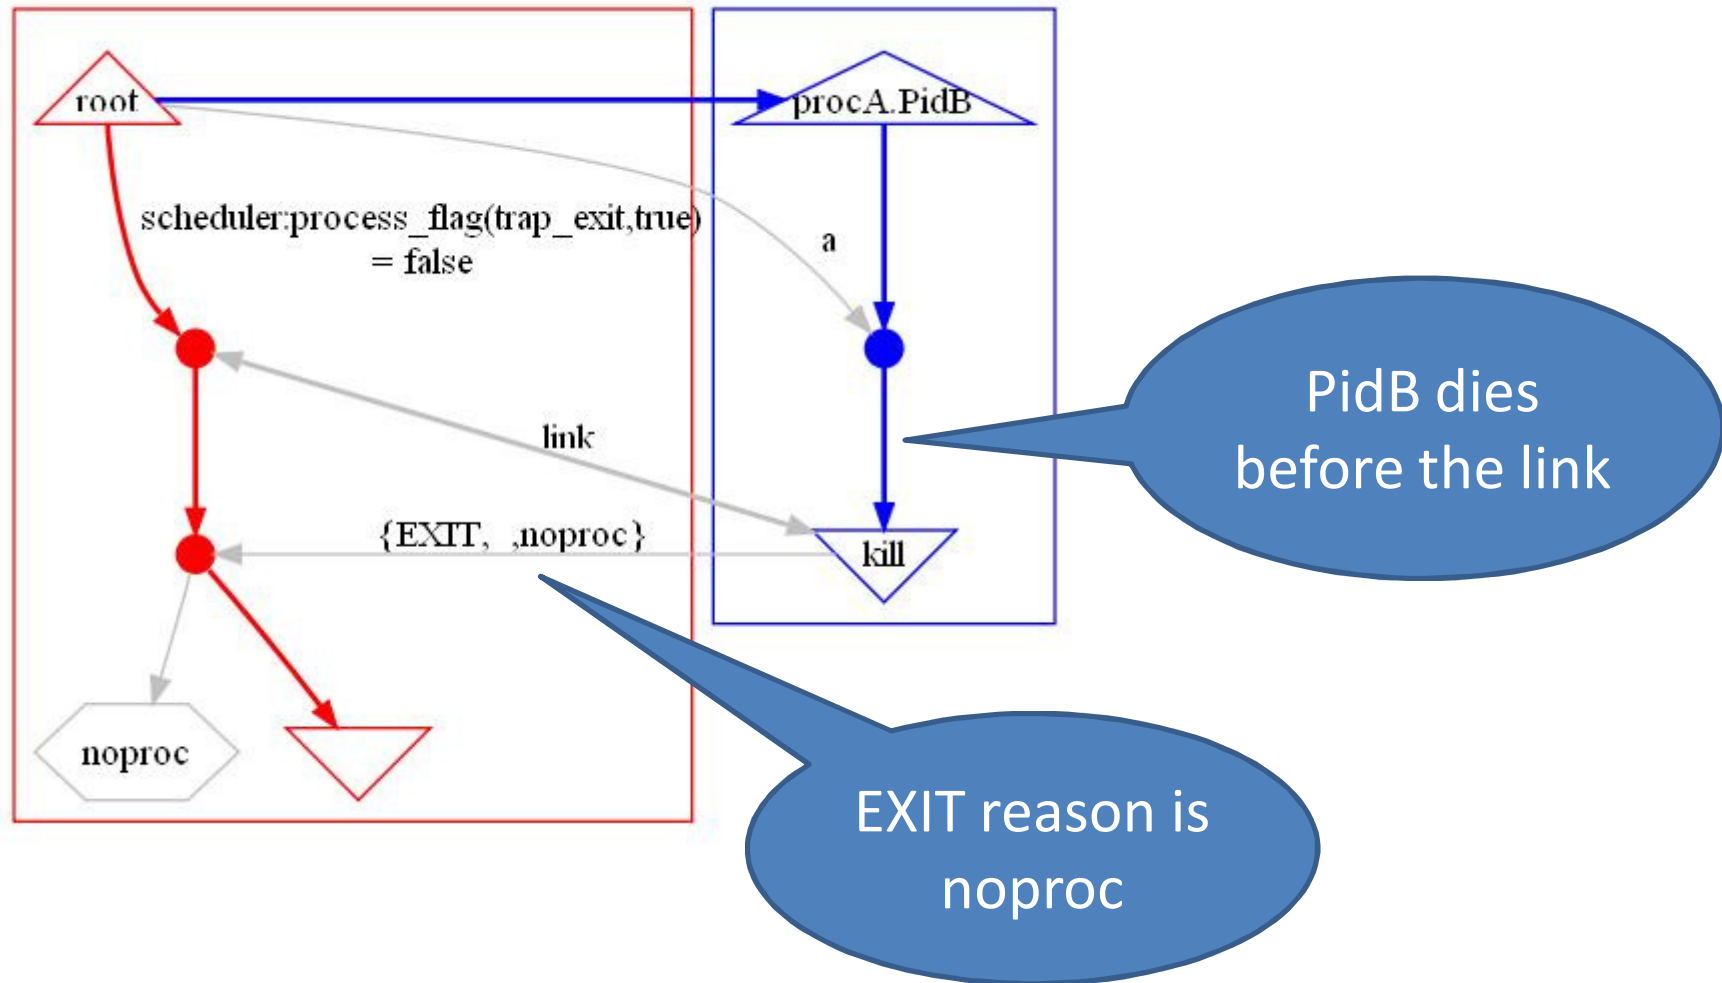

```
procA() ->
  PidB = spawn(fun procB/0),
  PidB ! a,
  process_flag(trap_exit, true),
  link(PidB),
  receive
    { 'EXIT', __, Why } -> Why
  end.
```

```
procB() ->
  receive
    a ->
      exit(kill)
  end.
```

One possibility

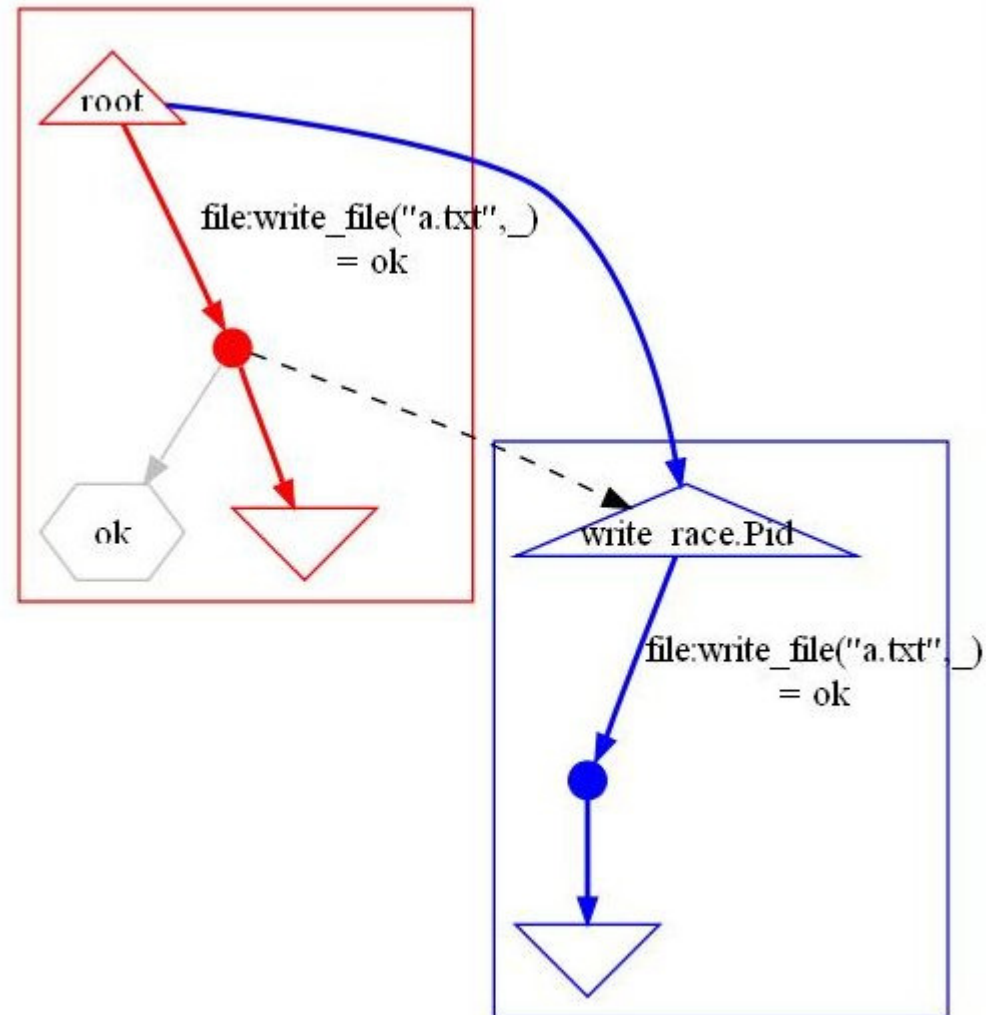

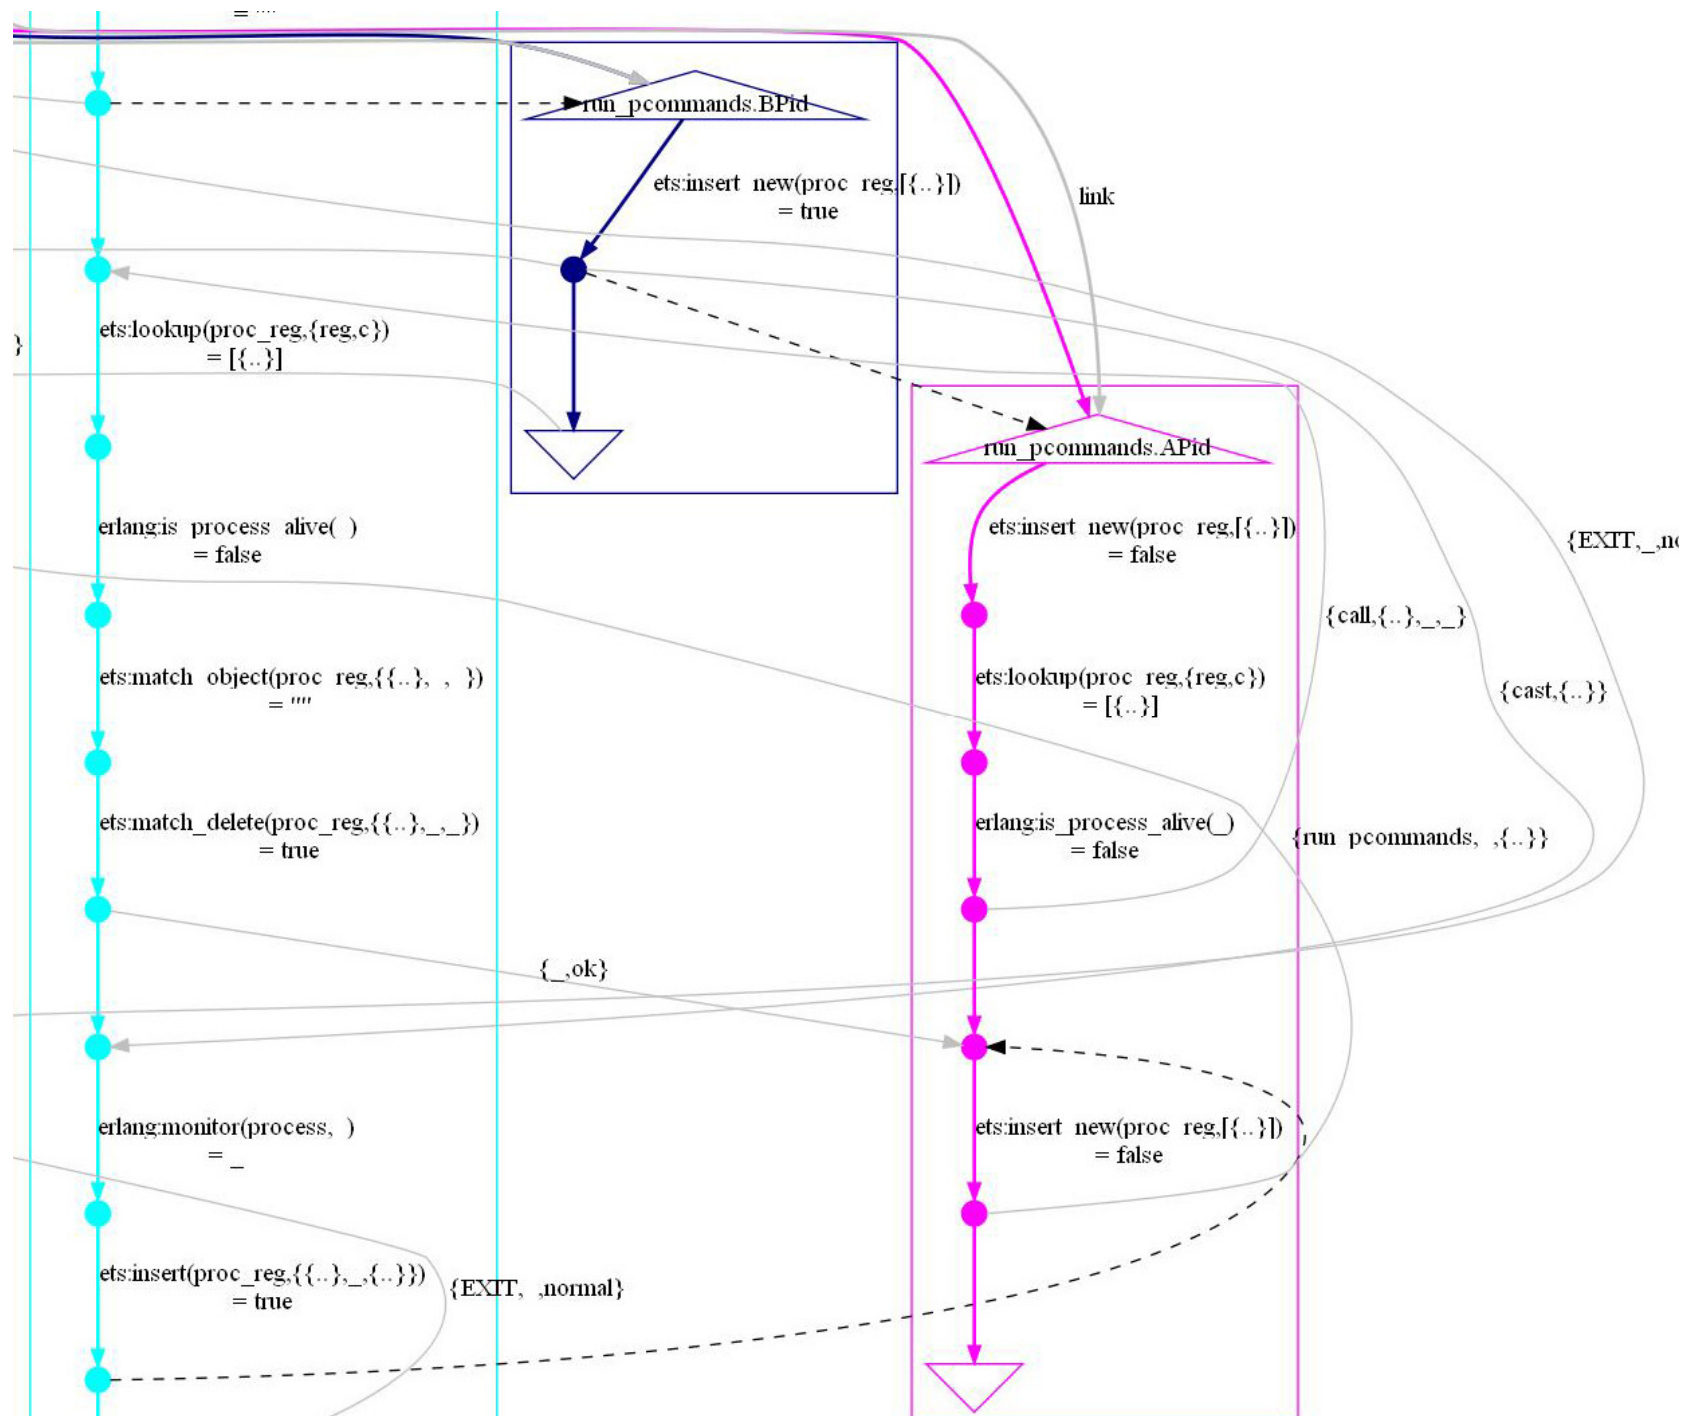

Another possibility

Side-effect order

- Two processes racing to write a file
- Order is not implied by message passing—so it needs to be shown explicitly

How does it work?

Client

ets:insert_new to add
{Name,Pid} to the registry

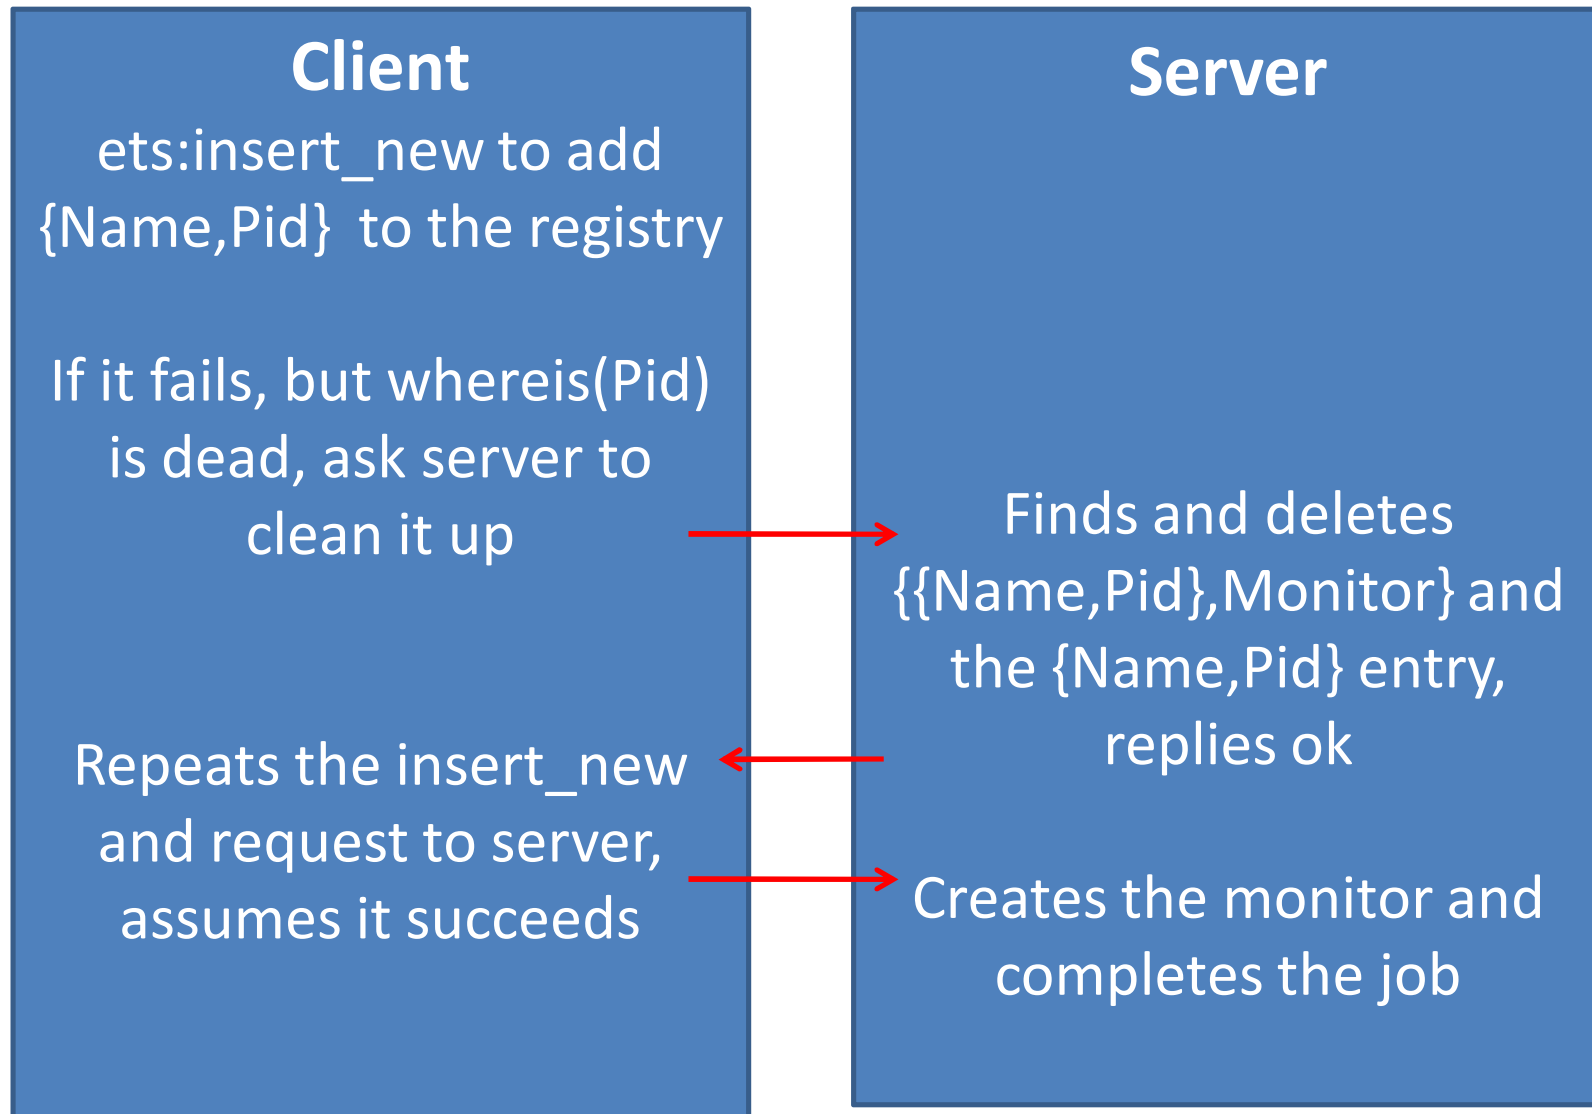

If successful, tells server to
complete addition

Server

Creates a monitor and
adds another entry
{{Name,Pid},Monitor}

How does it work?

Server gets
clean up request

First insertion

First
message

SE CLI CLI

Second

```
{[{set,{var,9},{call,proc_reg_eqc,spawn,[[]]}},  
 {set,{var,10},{call,proc_reg_eqc,kill,[{var,9}]}]},  
 [{set,{var,15},{call,proc_reg_eqc,reg,[c,{var,9}]}]},  
 [{set,{var,12},{call,proc_reg_eqc,reg,[c,{var,9}]}]}]}
```

entry

ERT 1 T 2

Second
insertion
attempt fails

A Fix

Client

ets:insert_new to add
{Name,Pid} to the
registry, *and a dummy
{{Name,Pid},Monitor}
entry*

If successful, tells server to
complete addition

Server

Creates a monitor and
adds the real entry
{{Name,Pid},Monitor}

Conclusions

- Property-based testing works just fine to hunt for race conditions
- PULSE makes tests controllable, repeatable, and observable
- Visualization makes it possible to interpret test traces
