The nine nines mats.cronqvist@klarna.com

Ruminations on tools and strategies.

With boring anecdotes!

rumination

- n 1: a calm lengthy intent consideration [syn: contemplation, reflection, reflexion, musing, thoughtfulness]
- 2: (of ruminants) chewing (the cud); "ruminants have remarkable powers of rumination"
- 3: regurgitation of small amounts of food; seen in some infants after feeding

this talk

- \Box the nine nines
- debugging in the telecom world
 debugging Erlang

the claim

"99.9999999% reliability (9 nines) (31 ms. year!)"

http://ll2.ai.mit.edu/talks/armstrong.pdf

"The AXD301 has achieved a NINE nines reliability (yes, you read that right, 99.9999999%). Let's put this in context: 5 nines is reckoned to be good (5.2 minutes of downtime/year). 7 nines almost unachievable ... but we did 9."

http://www.pragprog.com/articles/erlang

the evidence

ERICSSON 🔰

BT, UK chooses Ericsson and E telephony network to the world's

Situation: Business Drivers

- * Existing transit circuit-switched network needed modernization
- Rapid traffic growth from new and existing services
- Increase capacity and reduce cost through evolution to new multi-service communication system capable of carrying all telephony, data and multimedia services

Result

- 14 nodes carrying live traffic September 2002 out of planned 23 before end of 2002 (according to time plan)
 99,9999999% availability
- 1 30-40 Million calls per week & node

Management system Live cut-over from NB switches

Result

14 nodes carrying live traffic September 2002 out of planned 23 before end of 2002 (according to time plan)

- 99,9999999% availability
- 30-40 Million calls per week & node
- World's largest Telephony over ATM network
- Best Supplier of the year, 2000

the reaction

"Before a power failure drained the USV the server this blog has been running on had a uptime of about 420 days. So it had NO downtime in a year. Does this mean 100% reliability? No."

"So obviously Erlang is not the only thing which makes an AXD 301 tick. I assume there is also a lot of clever reliability engineering in the C code and in the hardware."

"There is no need use 99.9999999 % which ring so hollow."

http://blogs.23.nu/c0re/2007/08/

what I remember (a.k.a. The Truth)

(I was system architect/troubleshooter)

- The customer (British Telecom) claimed nine nines service availability integrated over about 5 node-years.
- As far as I know, no one in the AXD 301 project claimed that this was normal, or even possible.
- For the record, Joe Armstrong was not part of the AXD 301 team.

the claim is pretty bogus...

- there was much more C than Erlang in the system
- there were no restarts and no upgrades
- the functionality was very well defined

nevertheless...

- the system was very reliable
 compared to similar systems, it was amazingly reliable
- I have been unable to find any publicly available reference to this.
- An ancdote will have to do!

the Dark Side

Embedded system. Multi-million lines of C++. The disks were too small for core files. 100s of units deployed.

...but... The network worked.

why was it so stable?

- high quality programmers? no...
- superior system architecture? no...
- realistic project management? yes.
 testing and development were close
- highly stable infrastructure? yes.
 osolaris/beam/OTP
- properties of the Erlang language? yes.
 highly productive (small team)
 no memory management
 selective receive
 debugging

something rotten in Denmark...

- Embedded system running OTP R5.
- Live in Denmark.
- There was no way to log into the CPU.
- There was no way to load new code.
- There was no usable application debugging tool.
- You could physically connect a terminal.

The node got overloaded after 90 days. A tech traveled there and rebooted every 90 days.

...tracing...

- Wrote a one-liner...
- ...that ran a one-minute trace and wrote to a file.
- Sent it to the Danish tech by mail...
- ...who ran it by pasting it into a shell...
- ...before and after the reboot...
- ...and emailed the files to me (base-64 encoded)

...saves the day!

Wrote a comparison profiler. Compare the average execution time for each function, before and after the reboot.

ets:lookup/2 was 100 times slower before the reboot.

the answer

The hash function was broken for bignums.

the point...

Debuggability is a property of a system

In a distributed system, fail-stop bugs are easy

the 3 kinds of bugs

- It crashes "randomly"
- It uses too much of a resource
- It gives the wrong answer

strategies

	Monitoring	Narrowing
crashes	logging	context
performance		process \rightarrow
	logging	function
wrong result	contracts	context
	(test cases)	

polling

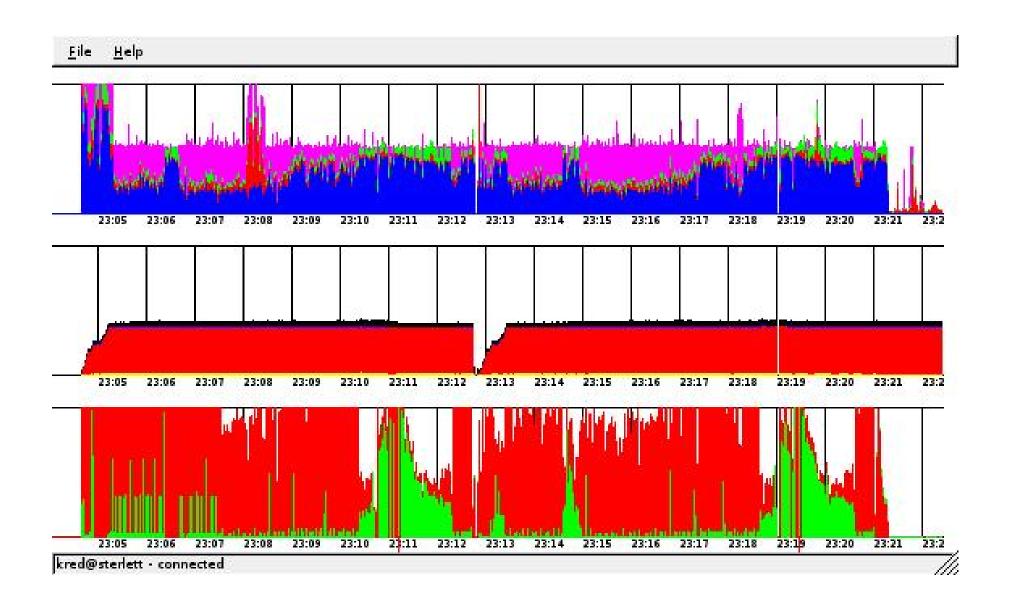

The Erlang VM has many info methods

- erlang:memory
- erlang:system_info
- erlang:statistics
- erlang:process_info
- inet:i().

Interrupts

The Erlang VM has 2 interrupt mechanisms

• erlang:trace/3 (redbug)

erlang:system_monitor/2 (watchdog)

UNIX strace

STRACE(1) STRACE(1)

NAME strace - trace system calls and signals

SYNOPSIS

•••

DESCRIPTION

Strace intercepts and records the system calls which are called by a process and the signals which are received by a process. The name of each system call, its arguments and its return value are printed...

dbg - cons

dbg is too hard to use correctly very tricky API not safe

needed:

- much simpler API
- safer

odisallow bad patterns

terminate if something bad happens

the Frankfurter

Pi = fun(P) when $pid(P) \rightarrow case process info(P, registered name) of[] \rightarrow case process info(P, initial call) of {, {proc lib, init p, 5}} \rightarrow proc lib:translate initial call(P); redbug

```
redbug:start("erlang:now->stack").
```

```
09:03:49 <{erlang,apply,2}> {erlang,now,[]}
{shell,eval_loop,3}
{shell,eval_exprs,6}
{shell,exprs,6}
```

redbug - safety

Safety comes from

- turns off if
 - o reach timeout
 - o reach number of trace message limit
 - trace messages are too large
 - $\circ\,\text{trace}$ messages coming in too fast
- disallows potentially dangerous traces

redbug trace patterns

```
redbug:start("ets:lookup").
```

```
redbug:start("ets:lookup(_,foo)").
```

```
redbug:start("ets:lookup(_,X)when X==foo").
```

```
09:46:22 <{erlang,apply,2}> {ets,lookup,[inet_db,foo]}
```

redbug - stack

```
redbug:start("ets:lookup(_,foo)-> stack").
```

```
09:48:03 <{erlang,apply,2}> {ets,lookup,[inet_db,foo]}
{shell,eval_loop,3}
{shell,eval_exprs,6}
{shell,exprs,6}
```

redbug - return

```
redbug:start("ets:lookup->return").
```

```
09:48:35 <dead> {ets,lookup,[foo,bla]}
09:48:35 <dead> {ets,lookup,2} -> {error,badarg}
```

redbug opts

time (15000) stop trace after this many ms msgs (10) stop trace after this many msgs proc (all) (list of) Erlang process(es) targ (node()) node to trace on

print_file (standard_io) print to this file file (none) use a trc file

conclusions

- Ireliability is easier in Erlang than in C++
- ...but not by any means automatic
- to get high reliability you need testing
- ...and debugging
- debuggability is a core strength of Erlang
- ...especially call tracing

eper.googlecode.com/
