35 BAGS OF SAND  
can dig down and add  
gravel for better drainage

<https://github.com/seth/pooler>

In the summer of 2010.

Coming home from work on the bus with a couple Opscode co-workers, discussing a weekend project I was planning for my backyard.

Passenger wonders what in the world we're working on.

# The Pooler Story

<https://github.com/seth/pooler>

answer: a sandbox.

Simple.

A box. Four sides. no bottom, no top.  
Nothing is simple.

When was the last time  
you used a saw?

Screws or nails? Type of wood? How should the corners go together?  
How much sand?

Each simple feature

a  
pile of  
complexity

<http://www.flickr.com/photos/davidstanleytravel/5282834545/>

it's amazing to watch.  
There's a special kind of unbreakable thread that connects a simple feature to a load of complexity.

**Each simple feature**

**1,750 lbs**

<http://www.flickr.com/photos/davidstanleytravel/5282834545/>

and my simple sandbox required almost 2K lbs of sand

# The Pooler Story

Seth Falcon  
Development Lead  
Opscode  
@sfalcon

So this is the story of building a SIMPLE connection pool.  
and how quickly it become not simple.

A photograph of a dirt path in a forest, covered with fallen leaves and moss. The path leads into the distance, flanked by green ferns and other foliage. A dark rectangular box is overlaid on the center of the path, containing the text 'A secret uncovered' in white, sans-serif font.

A secret  
uncovered

<http://www.flickr.com/photos/digitalrob70/6981414442/>

But it's also the story of uncovering a secret of building robust systems with OTP.

# Supervisor Driven Design

Think about the supervision tree as a principal aspect  
Understand new projects by visualizing the supervision tree.

## Erlang AND OTP IN ACTION

Martin Logan  
Eric Merritt  
Richard Carlsson  
FOREWORD BY ULF WIGER

SAMPLE CHAPTER

You start, if you haven't already, by reading these.  
When you are learning, you can't focus on supervisors first.  
You need to build an app

# Supervisors Supervisors Supervisors

You aren't using enough supervisors  
You aren't using them as effectively as you can

I expect to learn  
something

Going to share some discoveries (not my inventions) of what I think are good practices  
Hoping that it isn't: **you can do all of that with gproc and 3 lines of code**

# 2010

## We need an exclusive access connection pool

Once upon a time, it was September 2010. Experimenting with Riak.  
Pool Riak pb client connections and act as cheap load balancer

**Maintain a pool of members**  
**Track in use vs free members**

Simple. Right? And Erlang gives you all the primitives.

**Maintain a pool of members**  
**Track in use vs free members**  
**Consumer crashes, recover member**  
**Member crash, replace member**  
**Multiple pools**  
**Load balancing across pools**

**Start members asynchronously  
and in parallel**

**Start timeout?**

**Initial pool size vs max**

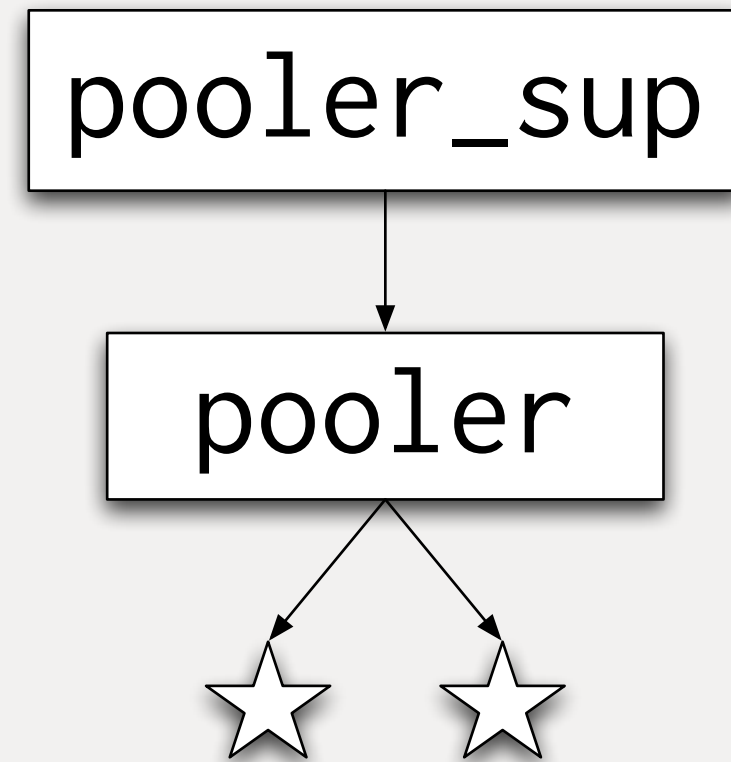

**Cull unused members after timeout**

**When to add members?**

# Version 0

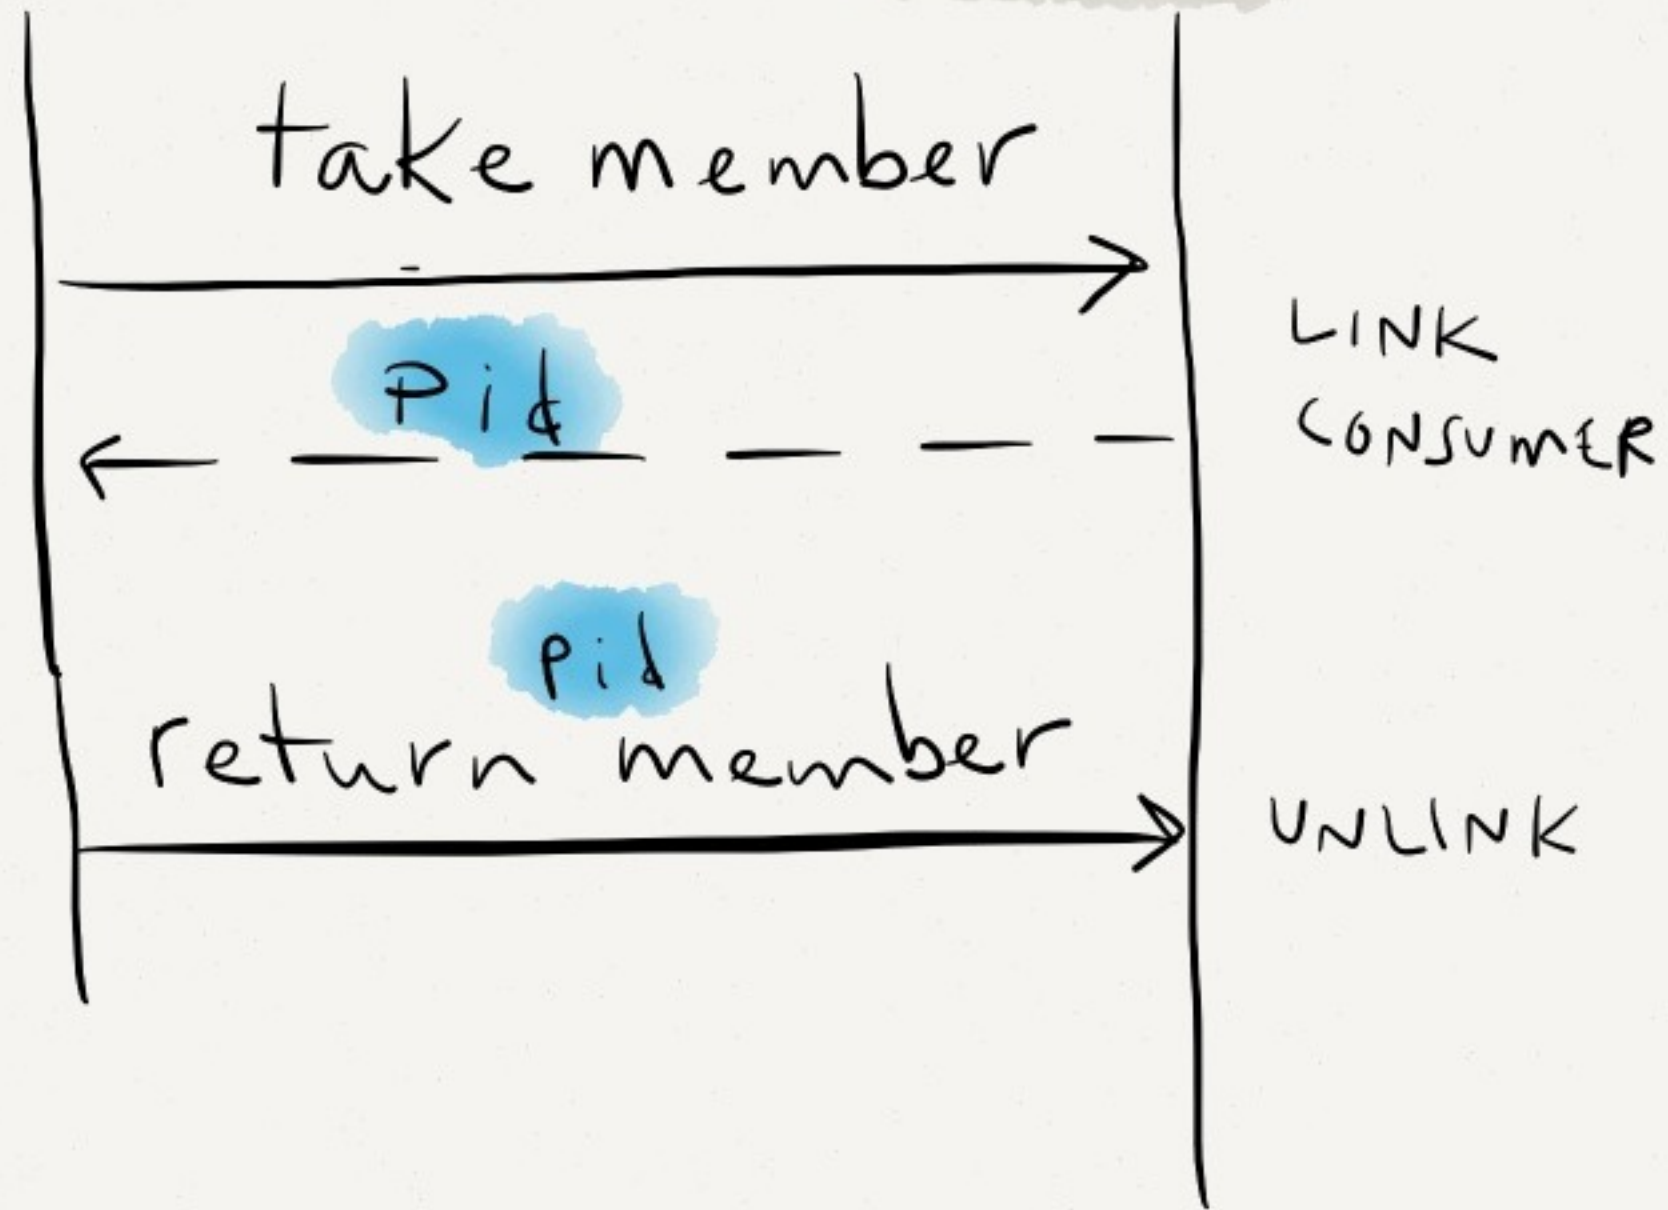

**pooler** is a **gen\_server**;  
calls **PoolMember:start\_link**

Version 0 is here for illustrating the evolution. Simplest possible thing.  
members are unsupervised.

CONSUMER

POOLER

Here's the basic message flow for using pooler

**LOST  
CHILDREN**

pooler\_sup

pooler

<http://www.flickr.com/photos/tdd/2696766506/sizes//in/photostream/>

Unsupervised children is sad panda.

**No unsupervised processes**

**(Rule 1)**

**Know your processes:**  
    **where they are;**  
    **where they're from**

**Hot code upgrade**

**Keep process spawning explicit**

**Know your processes:**  
where they are;  
where they're from  
Hot code upgrade  
Keep process spawning exp

The squid will come after you

easier to track down process leaks (which could, over time starve vm of ram)

# Version 1

**Rule 1 satisfied.**

# member\_sup supervises pool members

```
-module(member_sup).  
-behaviour(supervisor).  
-export([start_link/1, init/1]).
```

```
init({Mod, Fun, Args}) ->  
    Worker = {Mod, {Mod, Fun, Args},  
              temporary, brutal_kill,  
              worker, [Mod]},  
    Specs = [Worker],  
    Restart = {simple_one_for_one, 1, 1},  
    {ok, {Restart, Specs}}.
```

# pooler starts members with start\_child

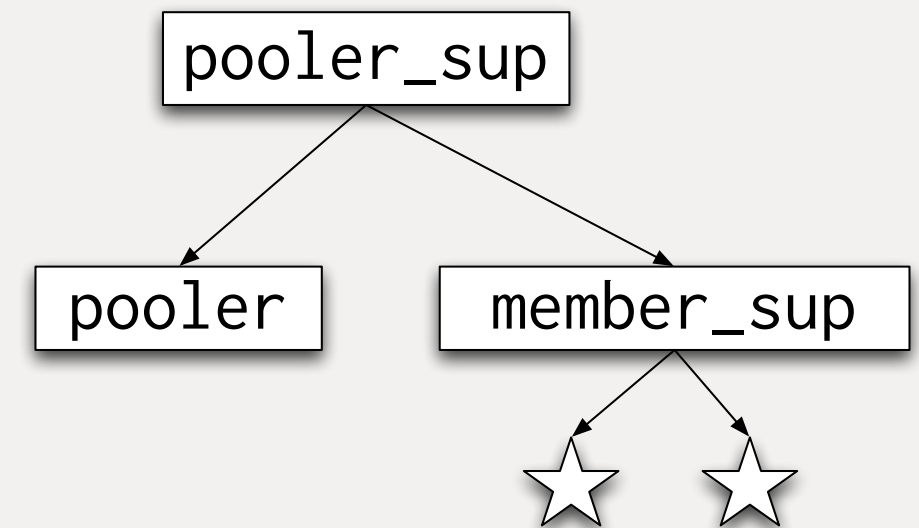

```
supervisor:start_child(member_sup, [])
```

# static child spec starts worker\_sup

```
-module(pooler_sup).  
-behaviour(supervisor).
```

```
init([]) ->
```

```
    Config = application:get_all_env(pooler),  
    Pooler = {pooler, ...},  
    MemberSup = {member_sup,  
                 {member_sup, start_link, [Config]},  
                 permanent, 5000, supervisor,  
                 [member_sup]},  
    Specs = [Pooler, MemberSup]  
    {ok, {{one_for_one, 5, 10}, Specs}}.
```

And finally, how the member\_sup is wired into the top-level supervisor in pooler

# No unsupervised processes

`supervisor:start_child`

`spawn`  
`start_link`

`supervisor`  
+  
`simple_one_for_one`  
`worker`

Look for instances of `spawn` and `start_link`. Add a `simple_one_for_one` supervisor and replace the `spawn/start_link` calls with `supervisor:start_child` calls.

# Version 1

**Rule 1 satisfied.**

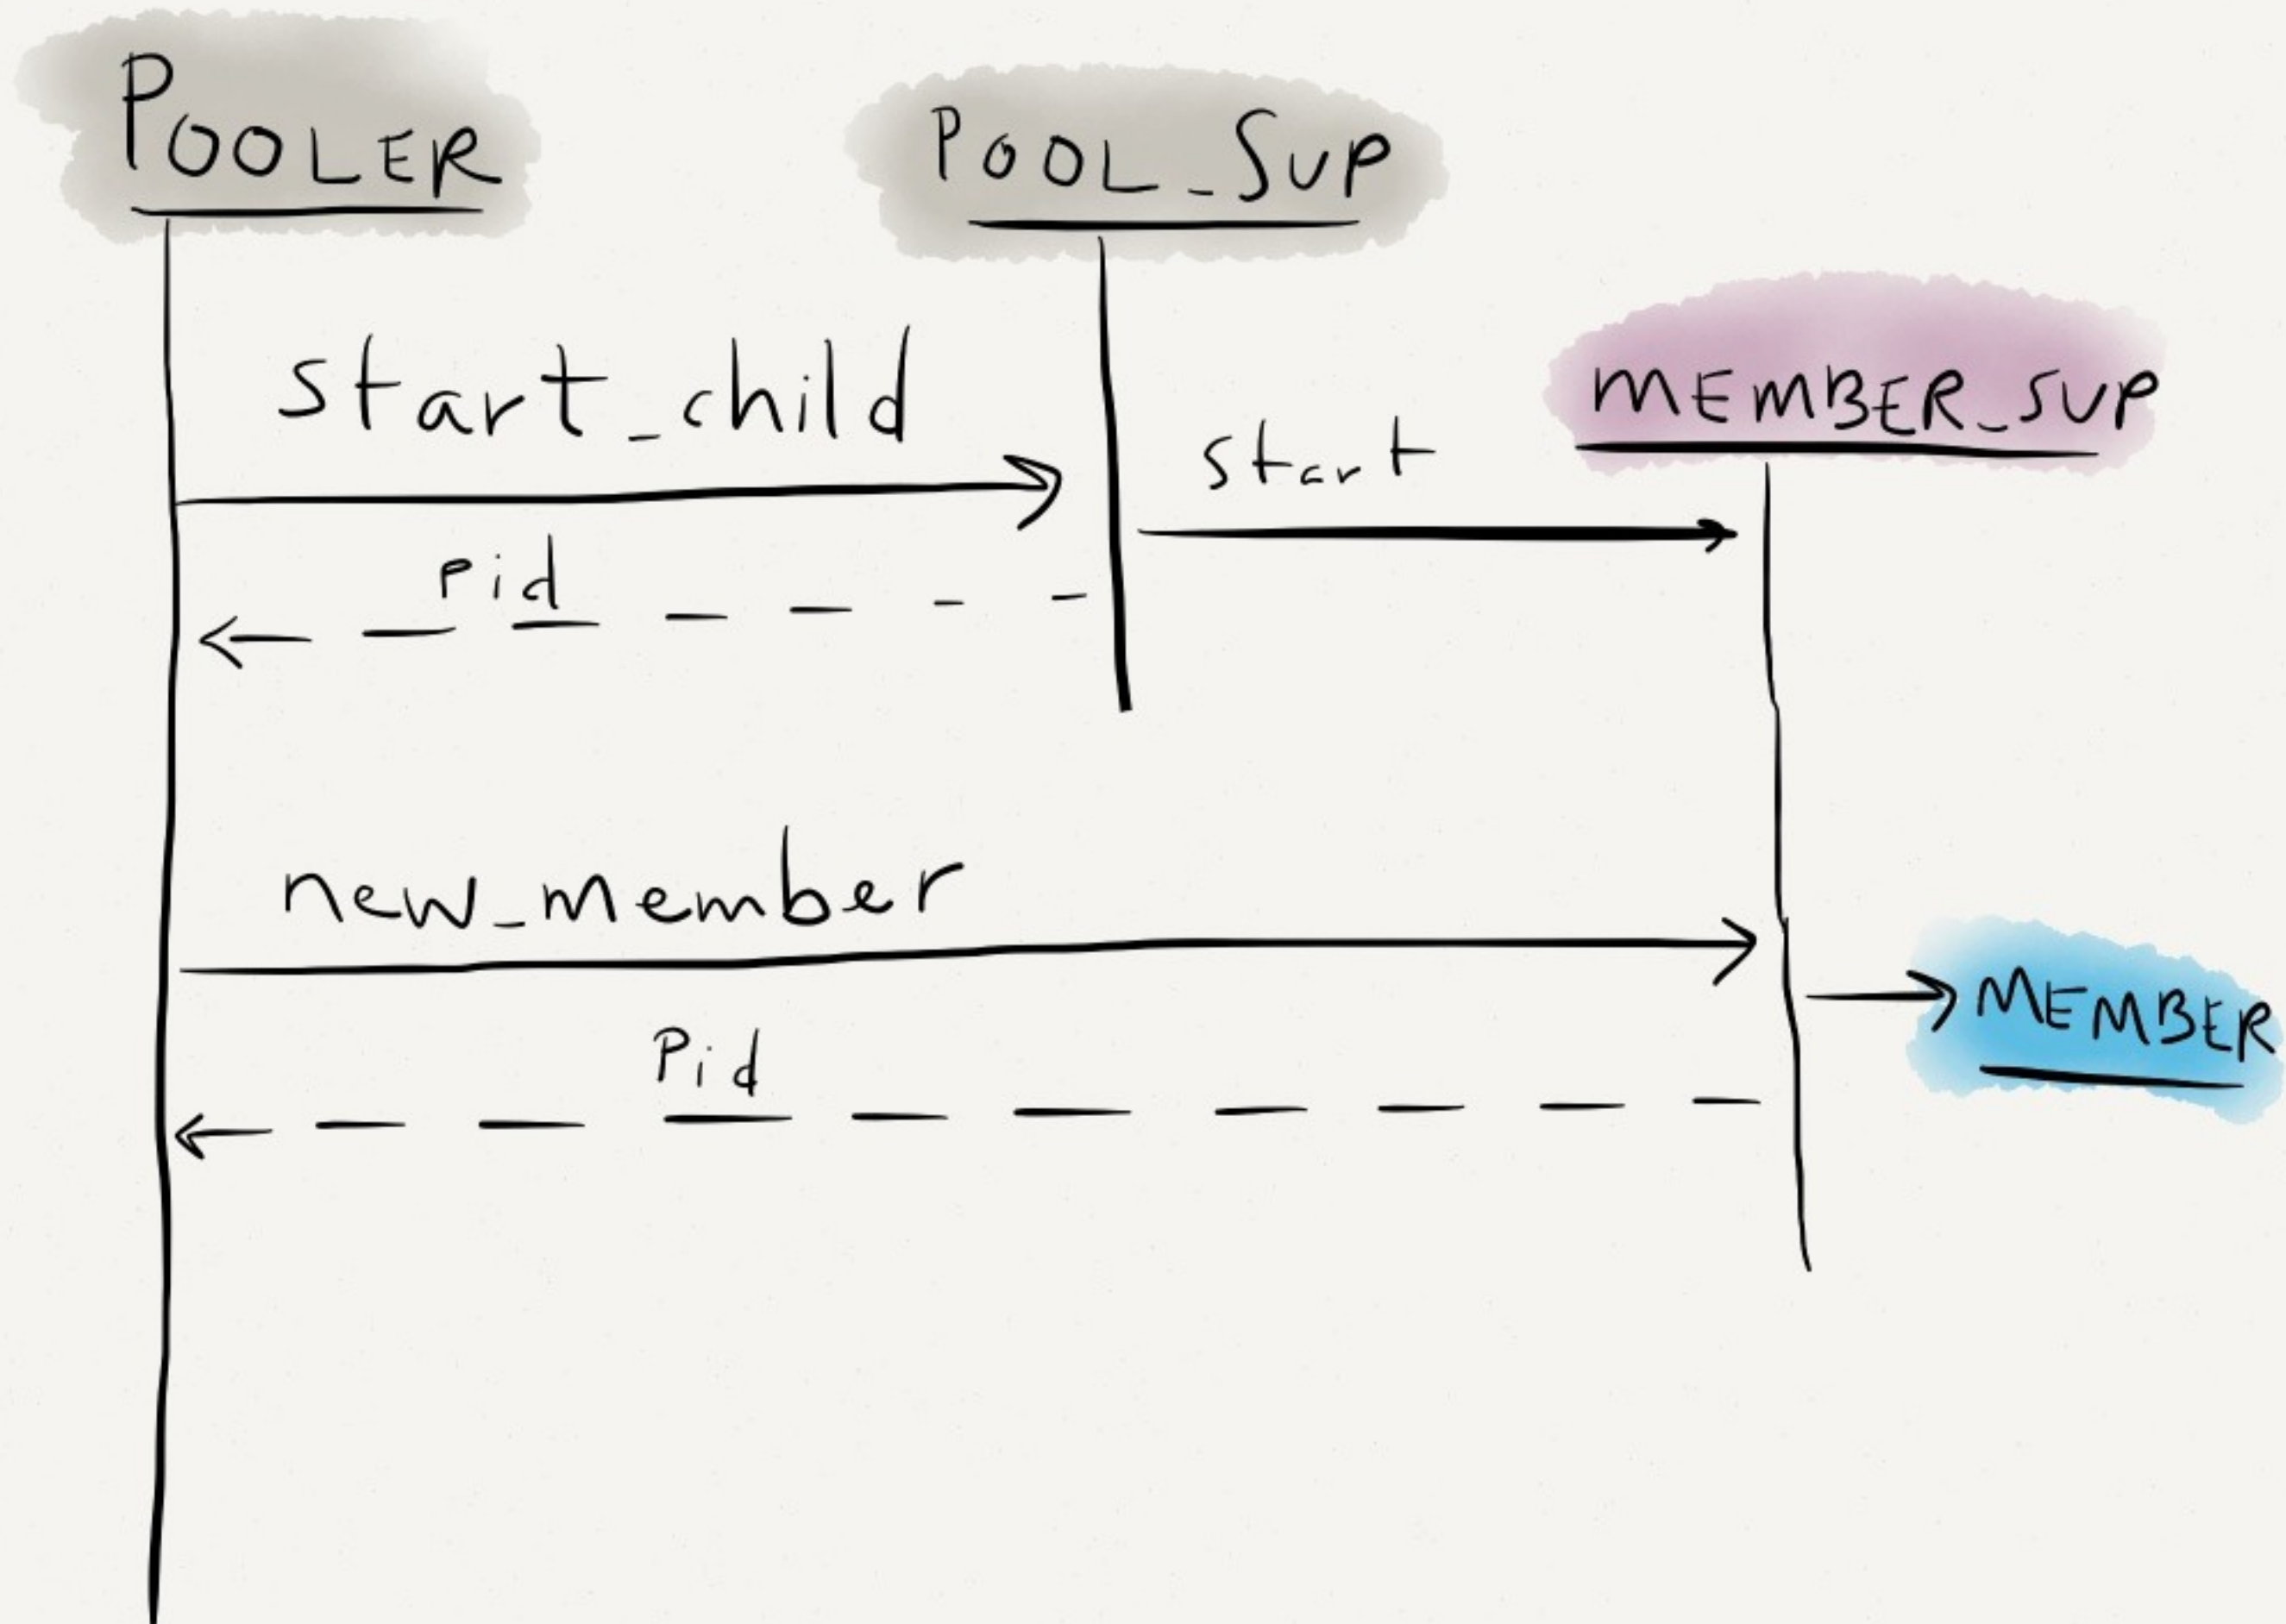

**But no multiple pools.**

The member\_sup carries the MFA to start a member of a given type  
Want each pool to have a member\_sup.

**Create supervisors  
dynamically**

`simple_one_for_one` and  
`supervisor:start_link` can be  
used for supervisors too.

Here's the message flow for pooler adding a new pool and then adding a new member to the new pool.

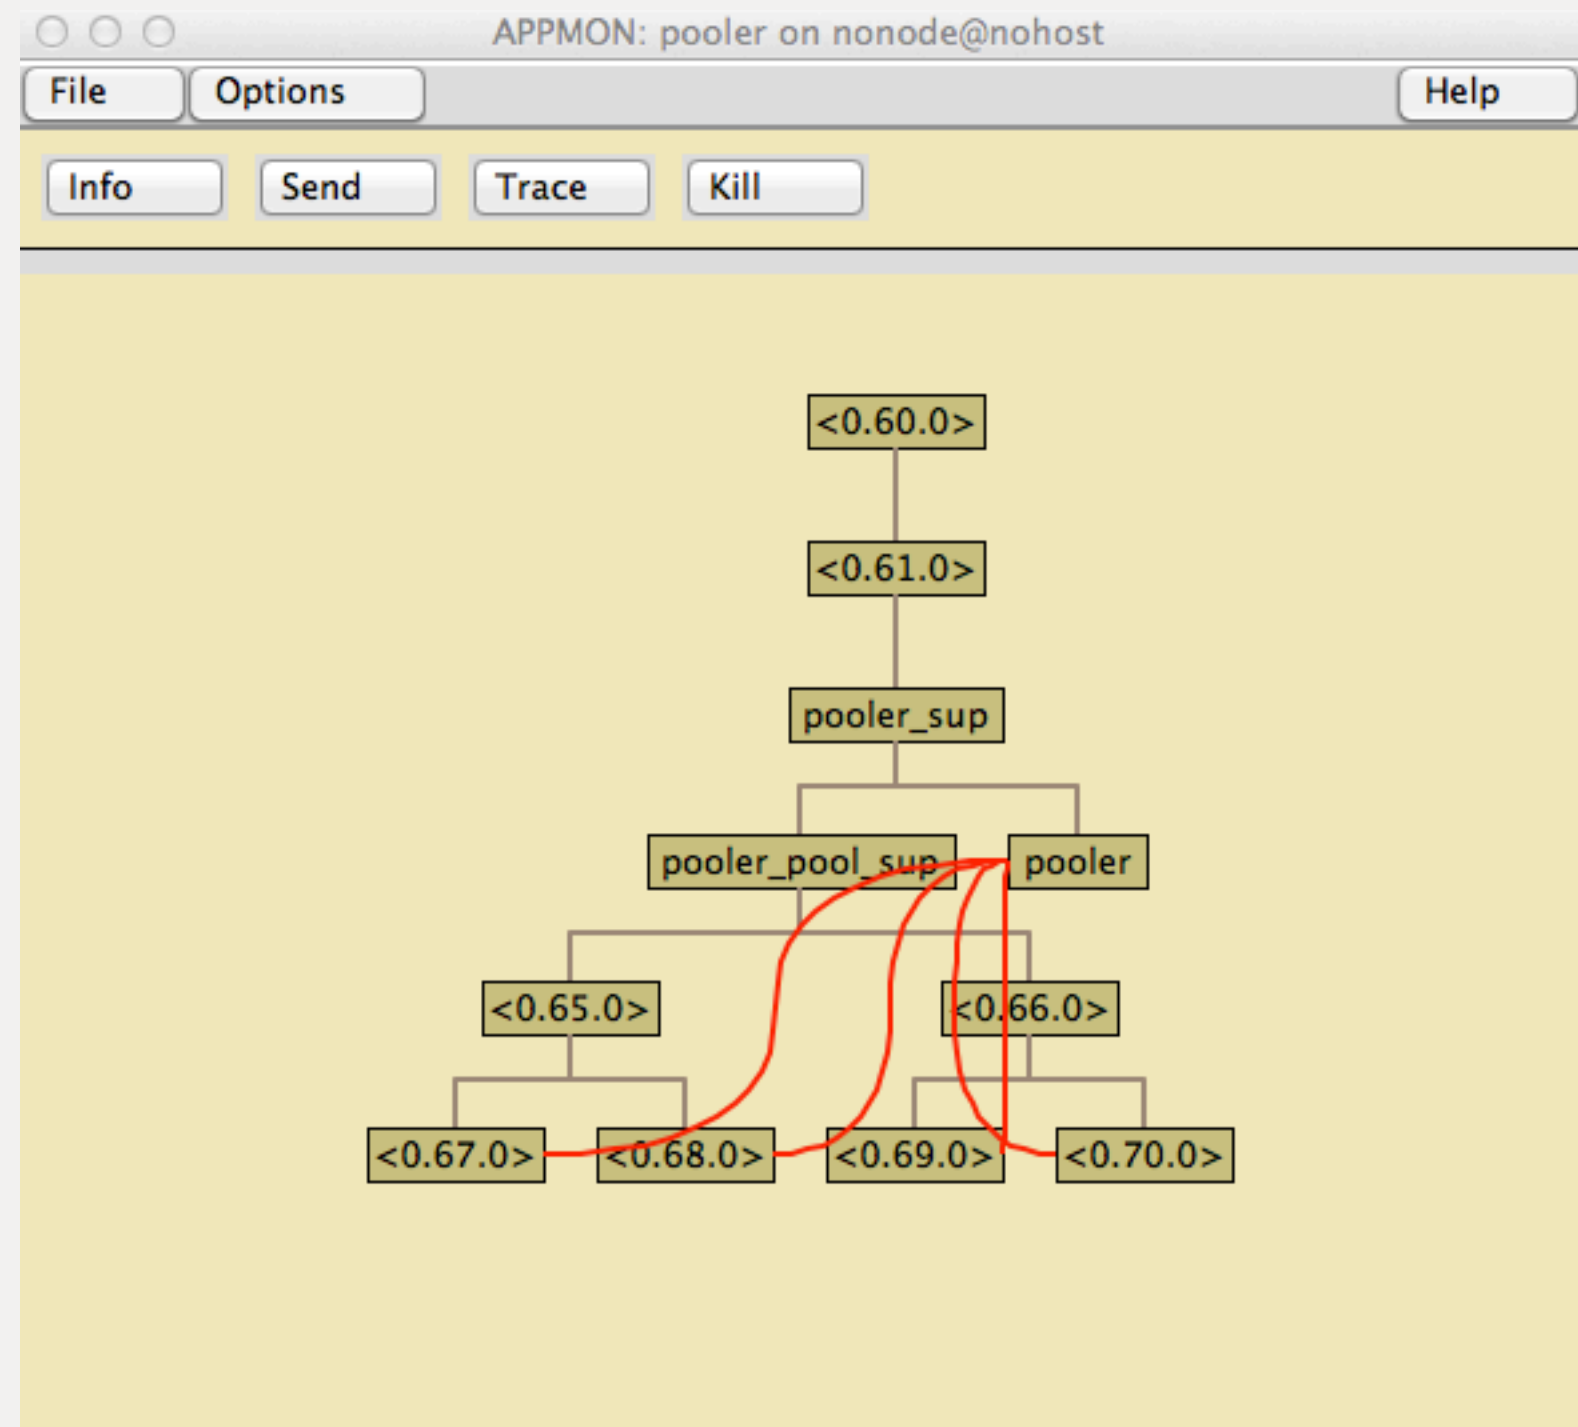

# Version 2

**Rule 1 satisfied.  
Multiple pools!**

multiple pools  
all supervised  
init\_count, max\_count  
cull\_interval, max\_age

This is the state of pooler 0.0.2.

<http://www.flickr.com/photos/8927927@N02/6837374725/>

OPSCODE

RULE THE CLOUD

2012

**Bad News...**

**They need the new stuff  
next week**

We were using poolboy, but saw lockup of pool under load. This was also found at basho and then fixed via QuickCheck. Bug related to queueing when full, different feature/complexity trade-off. pooler just returns an error when full. No queue. With pooler, no hang under load. But..

# Start Up Problems

pooler doesn't know about it's members. But needs member's apps to start before it.  
And wanted to keep pool config as static.

**pooler has no deps.  
pooler calls emysql:start\_link.**

**Who calls  
application:start(emysql)?**

# included\_applications

L: two separate apps  
R: one app includes another

# in your app:

```
1     {application, your_app,  
2     [  
3     {description, "Your App"},  
4     {vsn, "0.1"},  
5     {registered, []},  
6     {applications, [kernel,  
7                     stdlib,  
8                     crypto,  
9                     mod_xyz]},  
10    {included_applications, [pooler]},  
11    {mod, {your_app, []}}  
12    ]}.
```

To use pooler as an included app, do this

# in your app:

```
-module(your_app_sup).  
-behaviour(supervisor).
```

```
init([]) ->
```

```
    Pooler = {pooler_sup, ...},
```

```
    Worker = {your_worker, ...},
```

```
    Restart = {one_for_one, 1, 1},
```

```
    {ok, {Restart, [Pooler, Worker]}}.
```

and then start pooler's top-level supervisor somewhere in your supervision tree.

**in pooler:**

**take care with  
application:get\_env**

application\_get\_env/1 infers the application which will change if used in included\_application context.  
application\_get\_env/2 is unambiguous so you know where code will look for config.  
config should be name spaced so /2 is better all around.  
(20 min mark)

# Under Load

<http://www.flickr.com/photos/3059349393/3709115244/sizes/l/in/photostream/>

# Two things

<http://www.flickr.com/photos/3059349393/3709115244/sizes/l/in/photostream/>

Two small lessons learned when testing pooler embedded in a system put under load

**Cast is crazy, so call me  
(maybe)**

# When in doubt, call

Back pressure avoids  
overwhelming mailbox

Don't optimize with cast without measuring.  
If you know deadlock isn't a concern, try call first  
If call isn't fast enough, consider redesign, not cast

**Mind your timeouts**

Don't fear  $\infty$

```
gen_server:call(?SERVER, take_member, infinity)
```

**Members started  
in-line with pooler  
server loop**

**Slow member start  
triggers timeout**

**call +  $\infty$**

**Run slower**

**Degrade with load**

**But still run**

<http://www.flickr.com/photos/yourbartender/5379244544/sizes//in/photostream/>

Time to ride off into the sunset?

A sunset scene with a silhouette of a person on a horse on a hill. The sky is a mix of orange and yellow, with some clouds. The silhouette of the person and horse is on the right side of the image, standing on a dark hill. The overall mood is serene and peaceful.

Opscode

Load tested at Facebook

We're not done

# Single gen\_server serving all pools

Doesn't fit our our evolved use cases. Want to pool different things pg and redis. Want isolation.

# Can't dynamically add pools

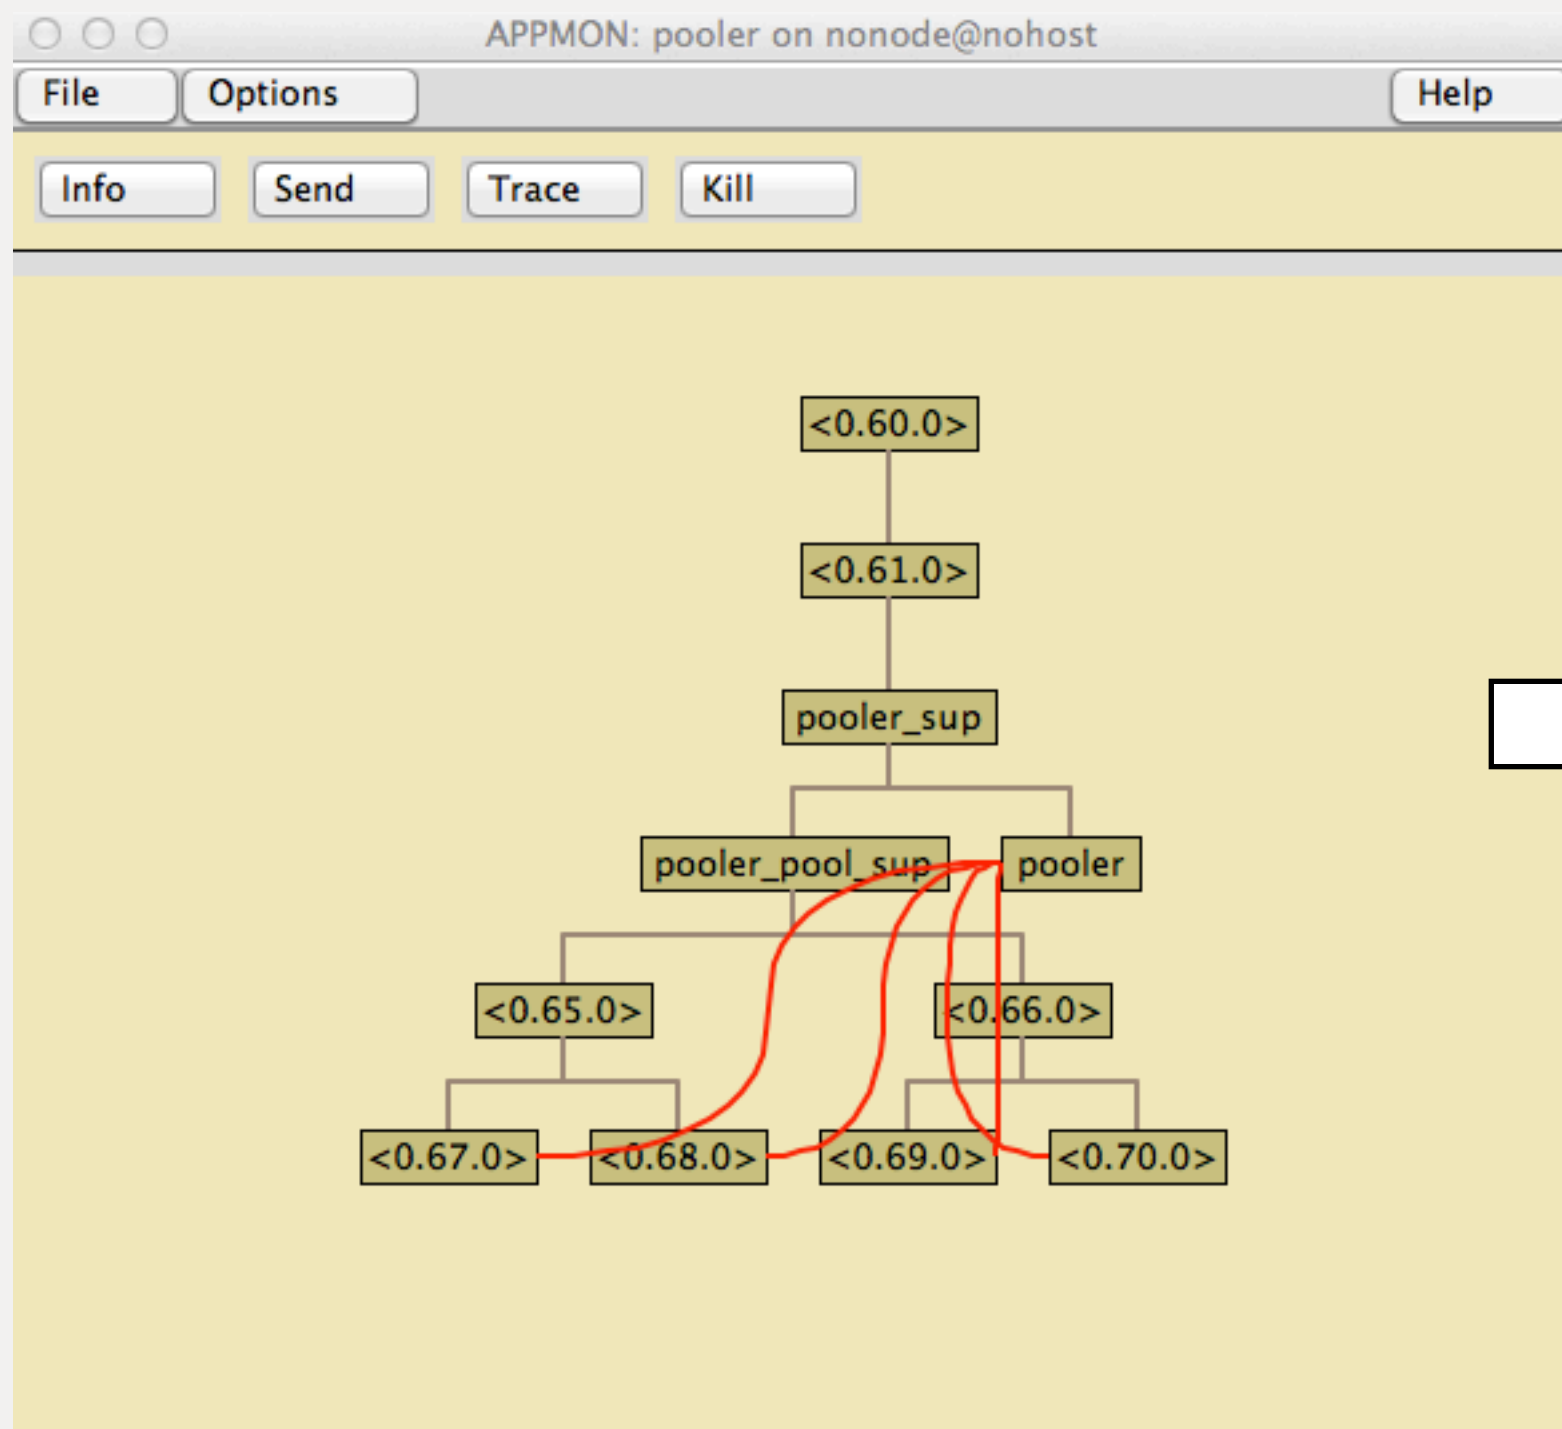

When pooling different things, adding pools at run time makes sense. Also solves the startup ordering problem.  
pooler should be more of a generic service. runs in the background.

# In-line synchronous member start

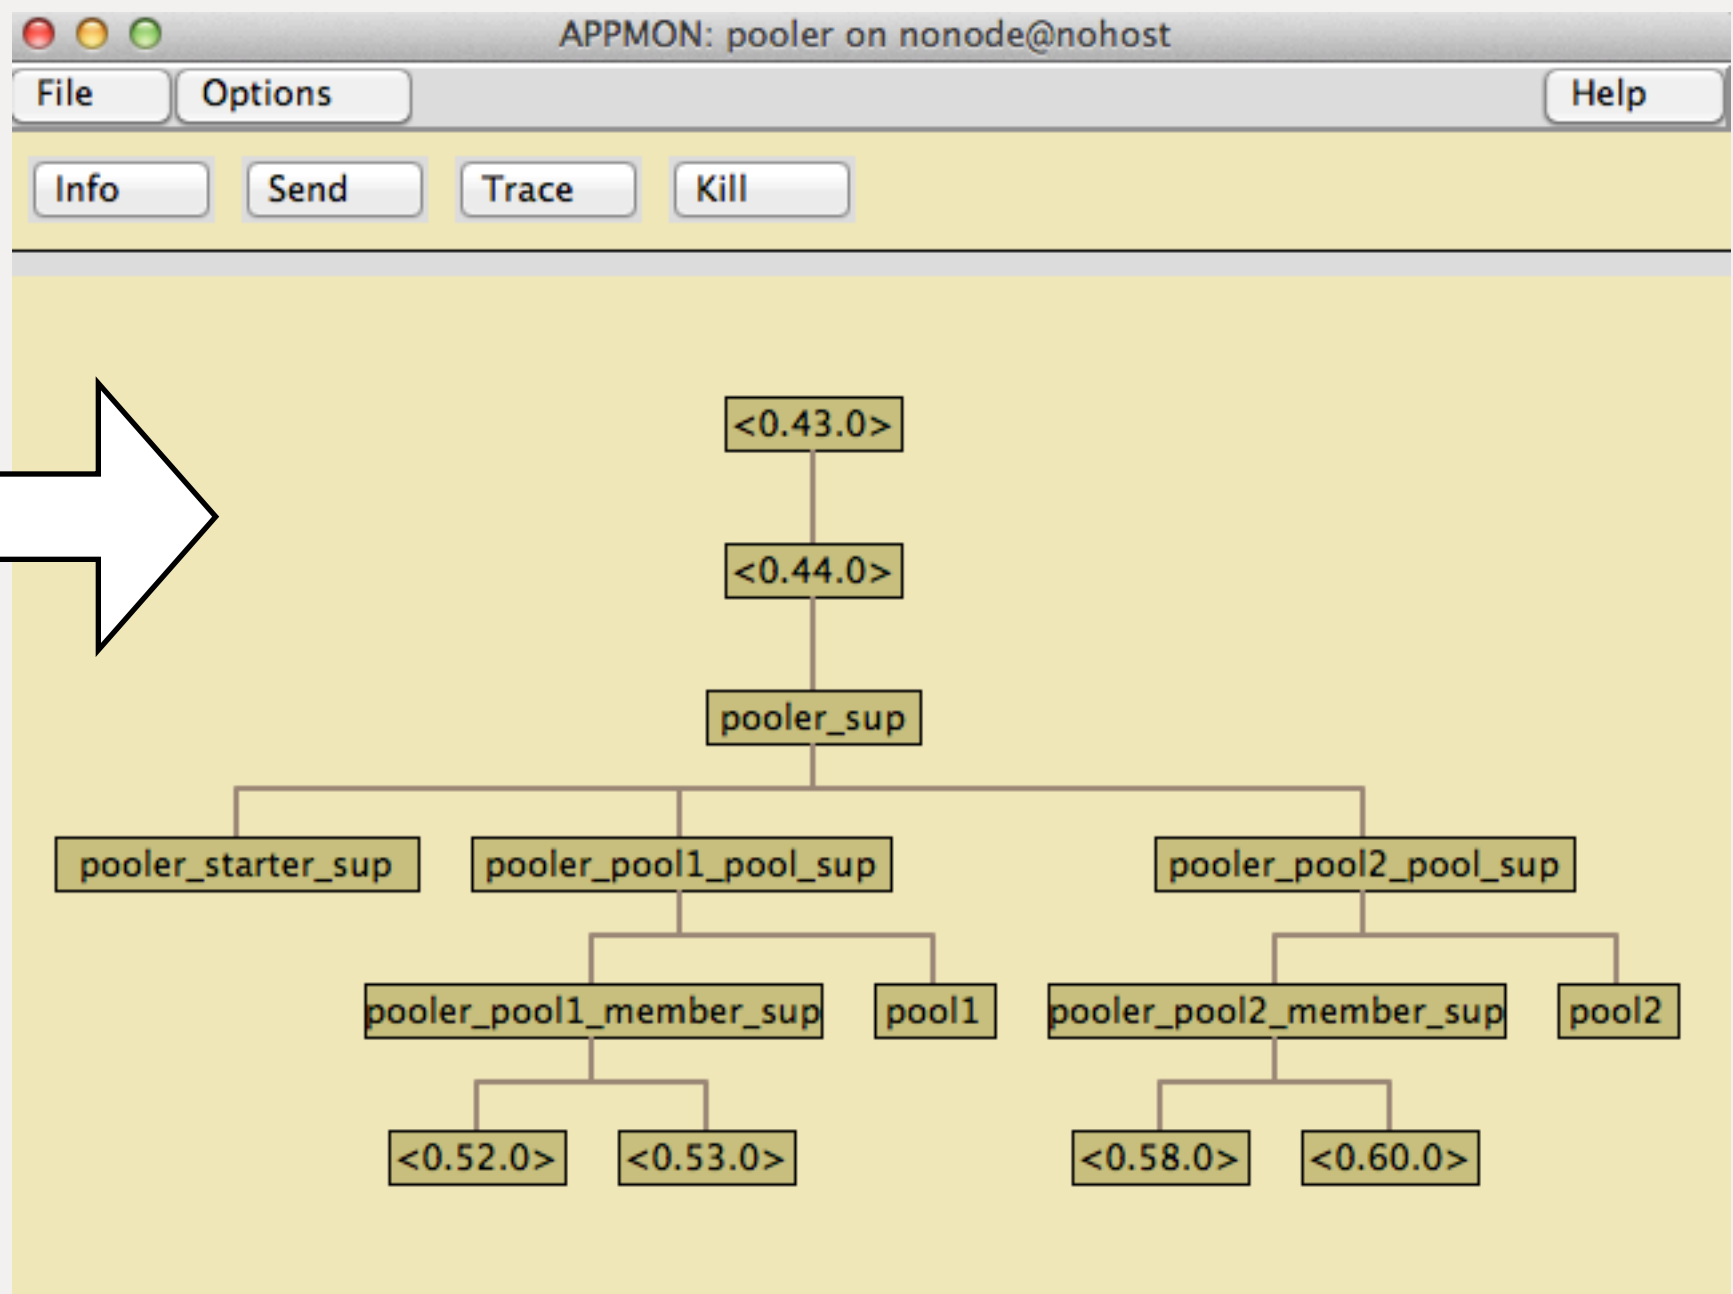

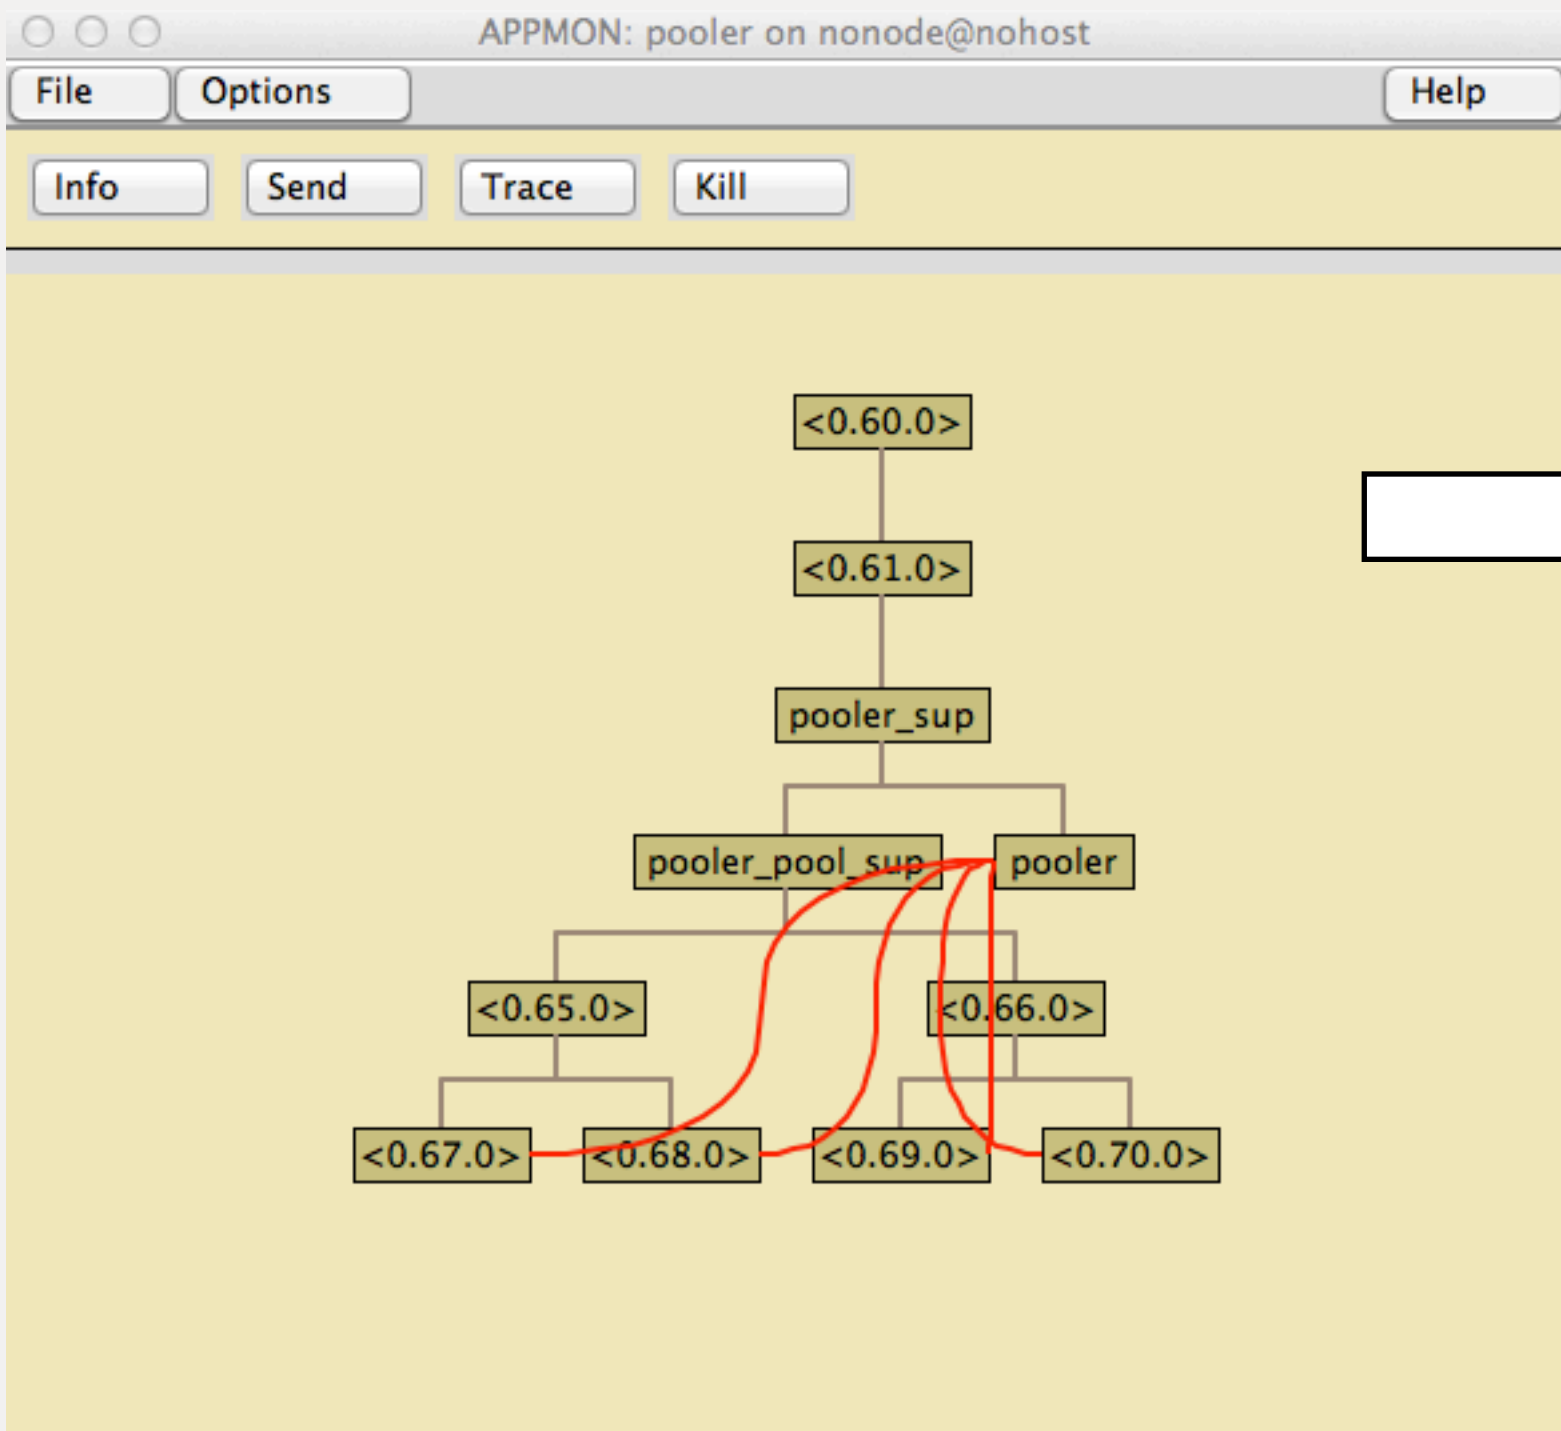

want improved dynamic pool growth -- add a batch, not just one  
minimize impact on perf for slow starting members and member crashes

# TODO

1. True multi pool
2. Async + parallel  
member start

What should the supervision tree look like?

# Create supervisors dynamically

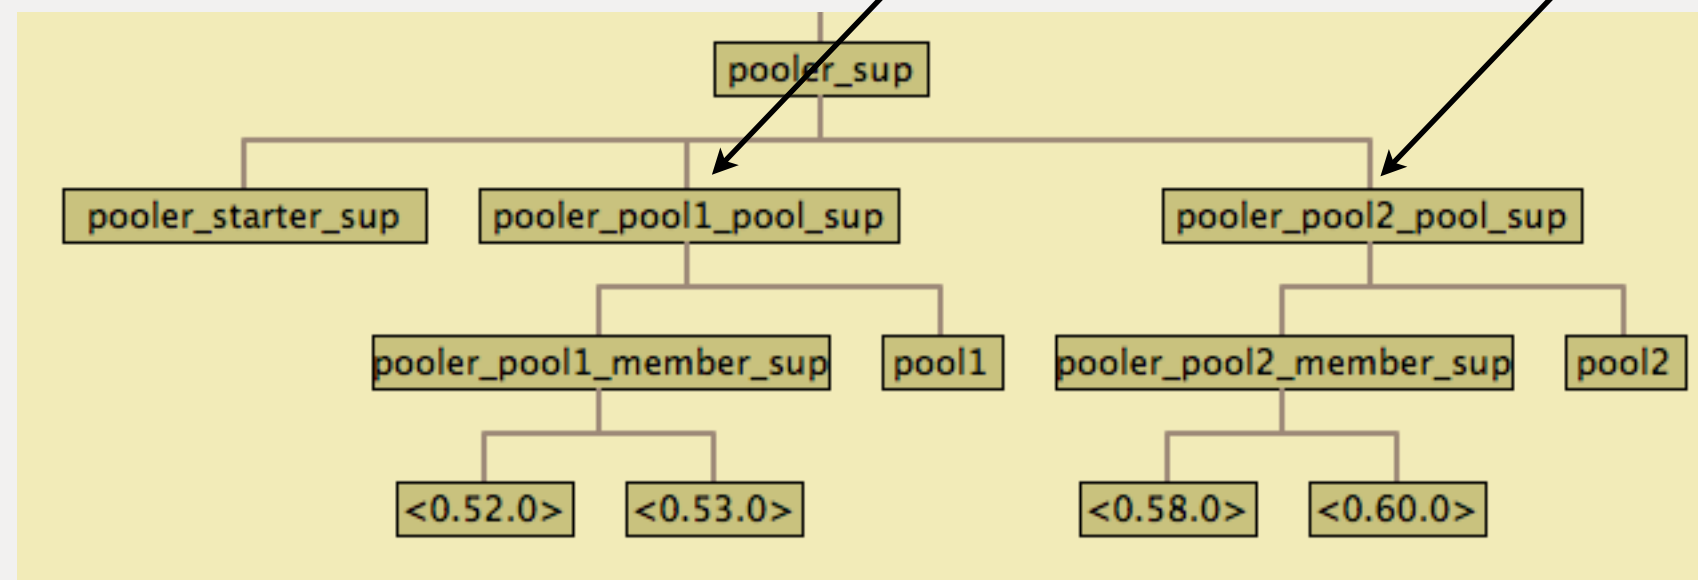

(take 2)

We did this already where we used a `simple_one_for_one` pattern to start new supervisors.

**Create child spec dynamically**  
**Call supervisor:start\_link**  
**(not simple\_one\_for\_one)**

```
pool_sup_name(Name) ->  
  list_to_atom("pooler_" ++  
    atom_to_list(Name) ++  
    "_pool_sup").
```

```
pool_sup_name(pool1)  
pool_sup_name(pool2)
```

```
new_pool(Config) ->  
  NewPool = pooler_config:list_to_pool(Config),  
  Spec = pool_sup_spec(NewPool),  
  supervisor:start_child(?MODULE, Spec).
```

```
pool_sup_spec(#pool{name = Name} = Pool) ->  
  SupName = pool_sup_name(Name),  
  {SupName, MFA, ...}.
```

# TODO

- ✓ 1. True multi pool
- 2. Async + parallel  
member start

# async start

`supervisor:start_child(PoolSup, [])`  
(blocks until child ready)

Need Another Process  
(it better be supervised)

POOLER

STARTER

start member

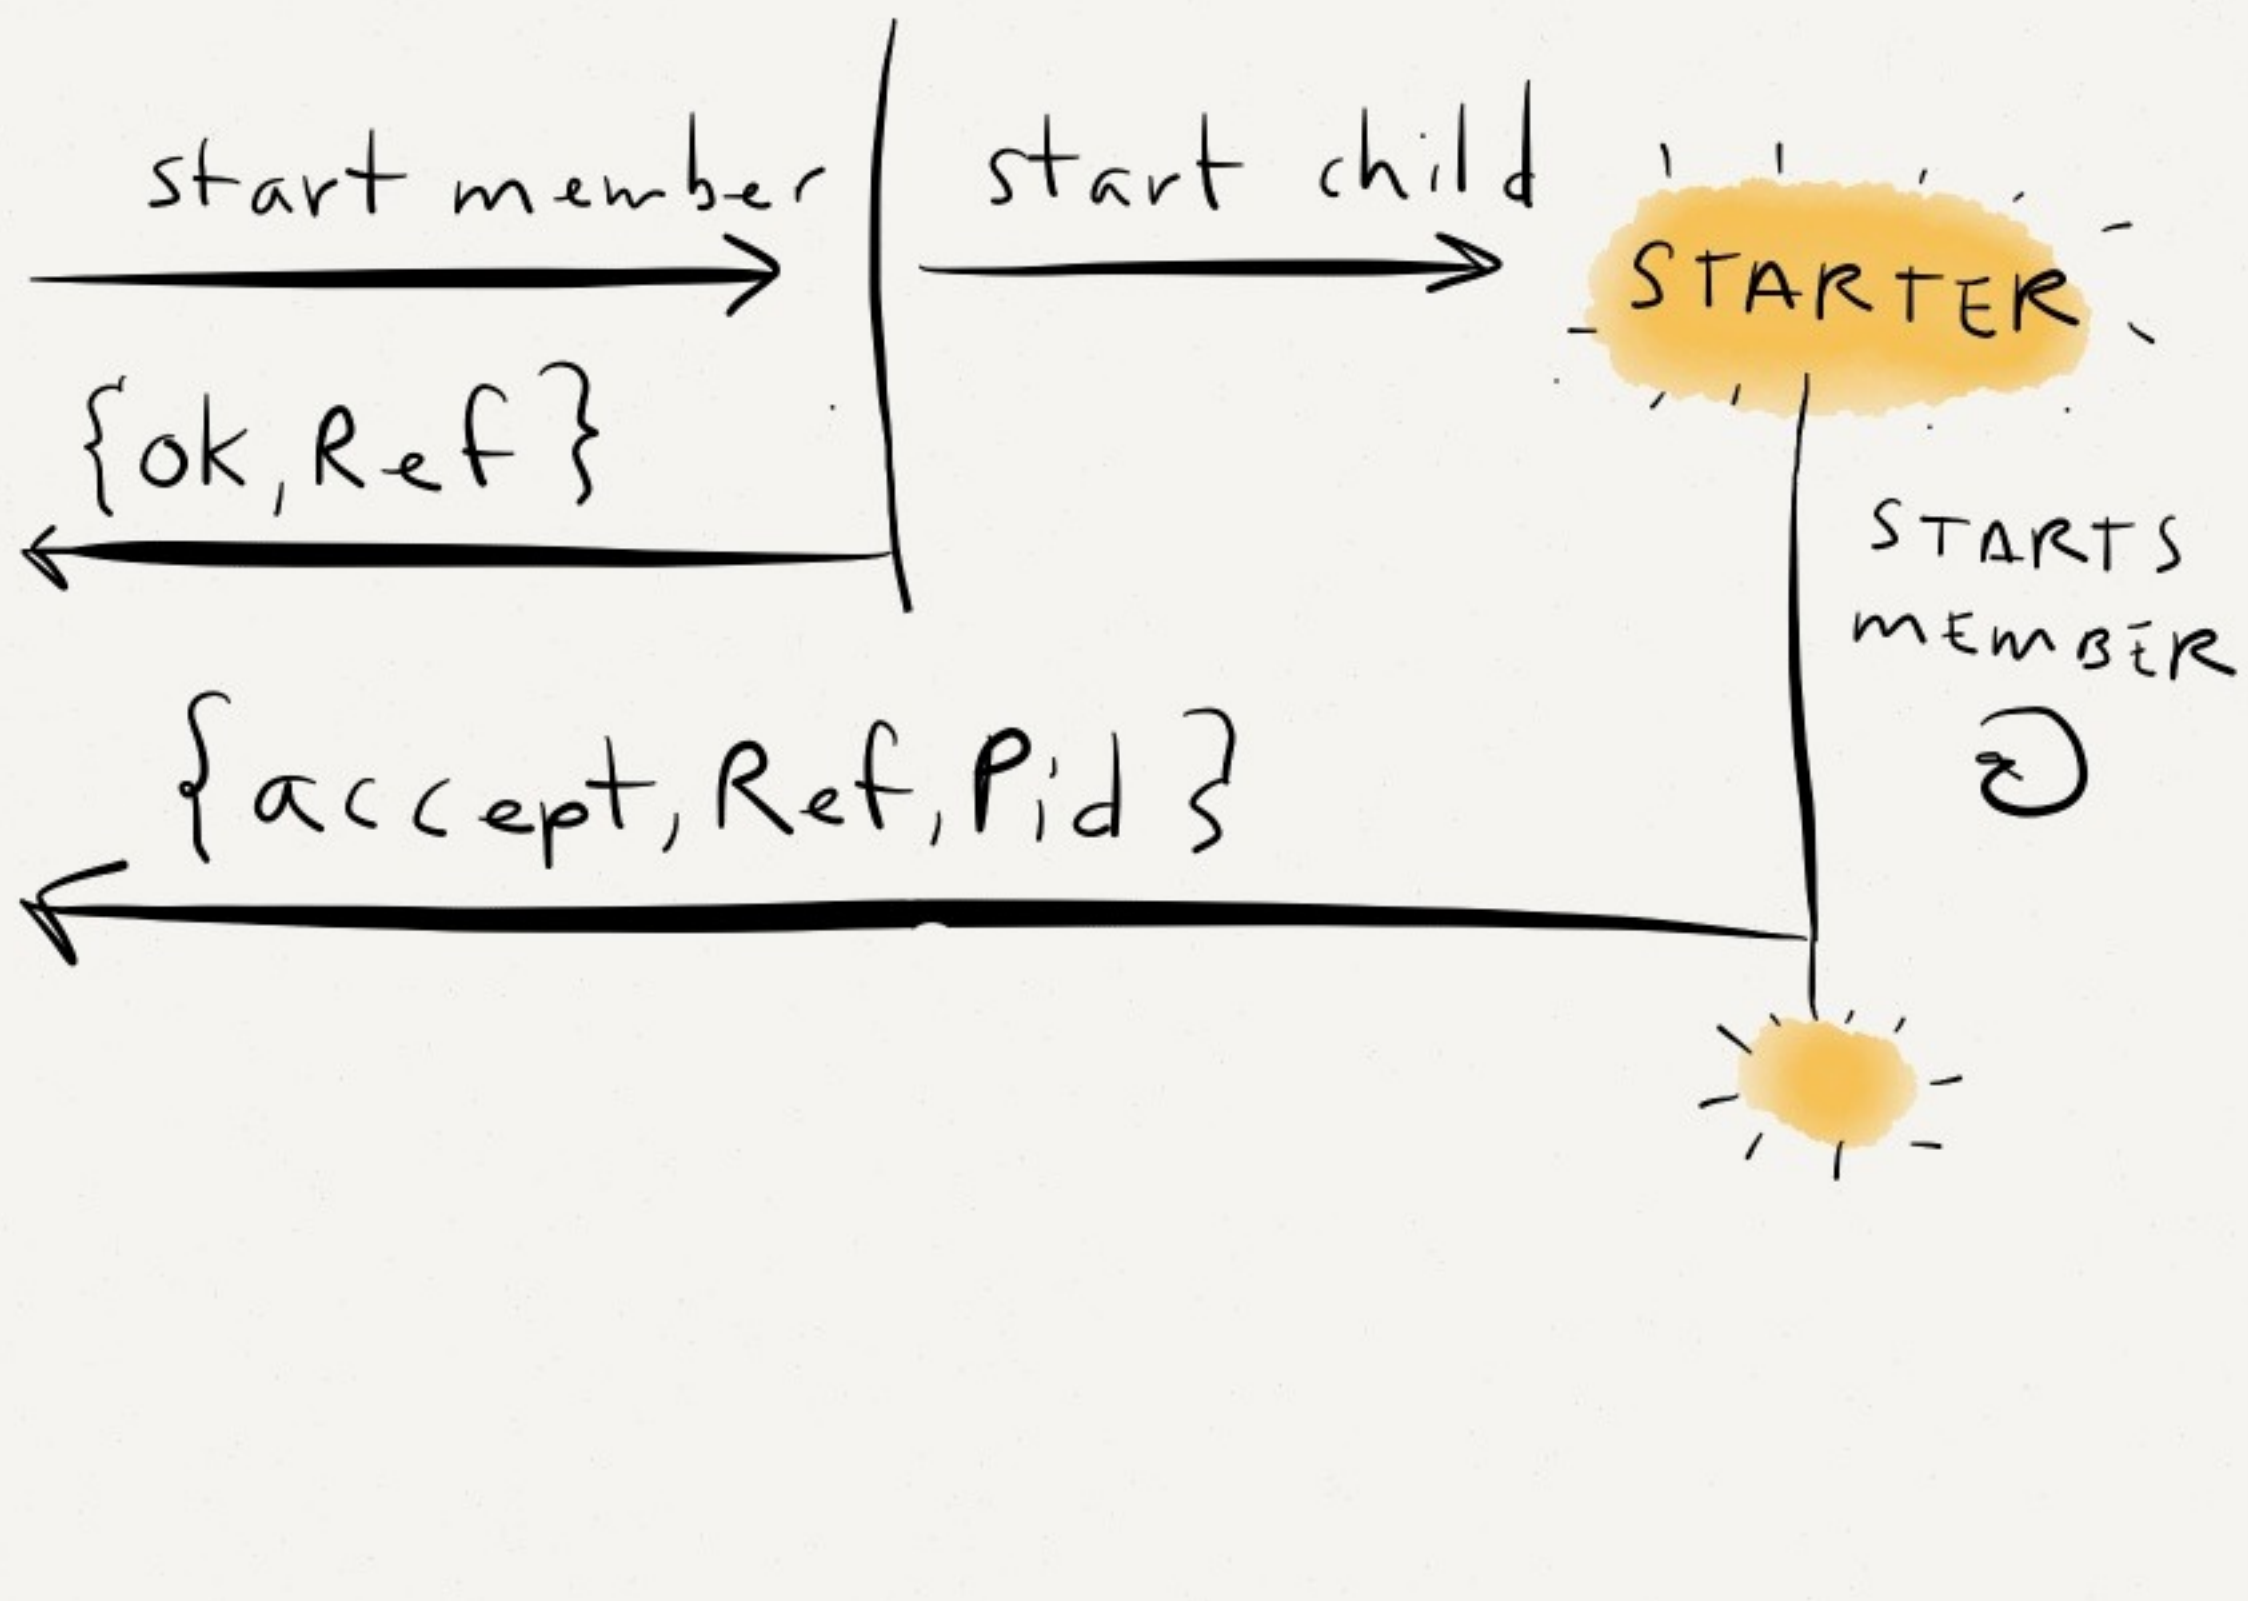

{ok, Ref}

{accept, Ref, Pid}

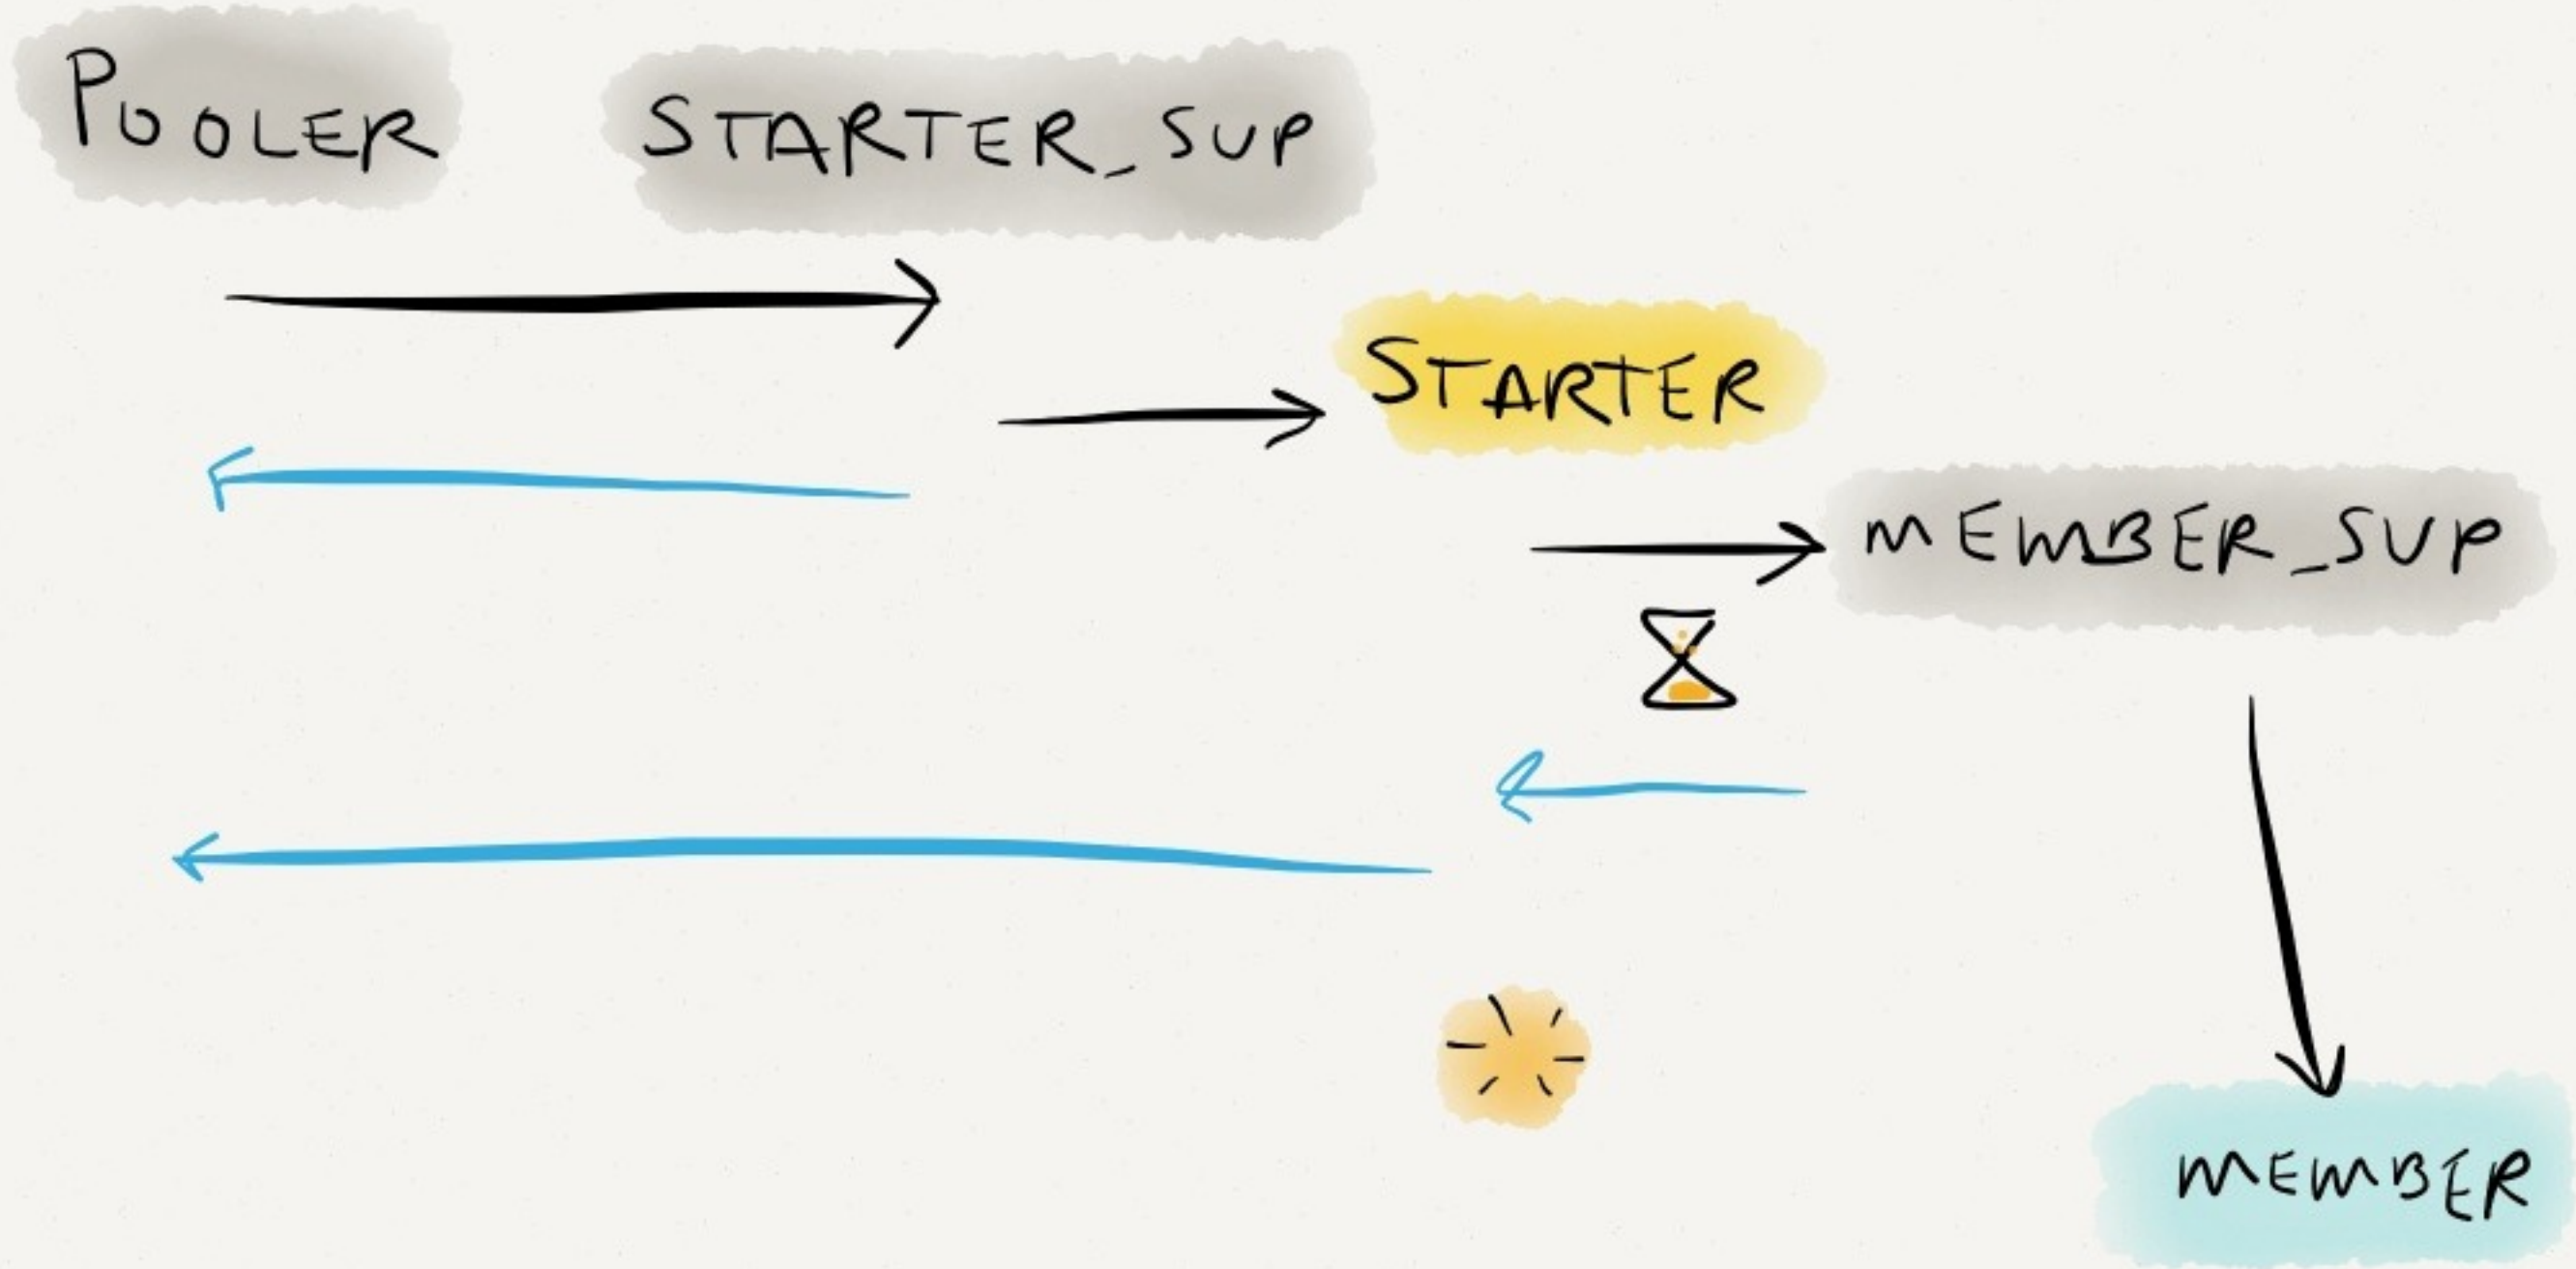

POOLER

STARTER\_SUP

Actual async member start uses starter\_sup and a single use starter gen\_server which triggers member start by setting timeout value to 0 in return from init/1. After creating member and sending msg to appropriate pool, starter exits normally.

**async + parallel start**  
(once running)

**but at init time,  
we want N**

```
do_start_members_sync(Pool, Count) ->  
  Parent = self(),  
  Pids = [ launch_starter(Parent, Pool)  
           || _I <- lists:seq(1, Count) ],  
  gather_pids(StarterPids, []).
```

```
launch_starter(Parent, Pool) ->  
  Fun = ...,  
  proc_lib:spawn_link(Fun).
```

```
do_start_members_sync(Pool, Count) ->
  Parent = self(),
  Pids = [ launch_starter(Parent, Pool)
           || _I <- lists:seq(1, Count) ],
  gather_pids(StarterPids, []).
```

```
launch_starter(Parent, Pool) ->
  Fun = ...,
  proc_lib:spawn_link(Fun).
```

**Think of the children!**

**Unattended Children  
will be given an espresso  
and a free puppy.**

<http://www.flickr.com/photos/digitalcolony/5179482430/sizes//in/photostream/>

**Come on,  
just this one time during  
init.**

**UNATTENDED CHILDREN**

**Will Be Given**

**Four Shots of Espresso**

**and a Wet Puppy**

**To Take Home**

<http://www.flickr.com/photos/williamsdb/5613957765/sizes/l/in/photostream/>

POOLER

STARTER

N start msgs

N replies
